

Administrative Areas

Commissioner District

Shapefiles, .tiff and MrSID

Tags

districts, district, board, boundaries, boundaries, commissioner, vote

Summary

The feature class is used mainly by the Register of Deeds office, who uses the districts for cartographic output.

Description

This polygon feature class contains Oakland County Board of Commissioner (BOC) Districts. The key attributes are District (the BOC district) and CommissionerName (the representative name). The feature class was based on Oakland County's municipal districts, roads, and parcels.

Community College

Summary

This feature class is primarily for the purpose of cartographic output and spatial analysis.

Description

A spatial representation of the Community College District Boundaries. This polygon feature class was initially derived with data from School District, Tax, and Municipal feature classes and historical School Board correspondence. The key attribute is Name (the Community College name).

Municipal District

Shapefiles, .tiff and MrSID

Tags

boundaries, boundaries, townships, municipal boundaries, corporate boundaries, cities, villages, minor civil divisions

Summary

The primary purpose of this feature class is spatial analysis and cartographic output.

Description

A spatial representation of municipal boundaries. This polygon feature class was derived from the 1998 Parcel polygon feature class and was based on a common city/village/township (CVT) code as maintained in the Oakland County Land Records database. Key attributes include the Name (CVT name) and Type (CVT type: city, village, general law township, charter township), and SquareMiles (area of each CVT). In addition, state, county and municipal FIPS codes are included.

Municipal District

Shapefiles, .tiff and MrSID

Tags

boundaries, boundaries, townships, municipal boundaries, corporate boundaries, cities, villages, minor civil divisions

Summary

The primary purpose of this feature class is spatial analysis and cartographic output.

Description

A spatial representation of municipal boundaries. This polygon feature class was derived from the 1998 Parcel polygon feature class and was based on a common city/village/township (CVT) code as maintained in the Oakland County Land Records database. Key attributes include the Name (CVT name) and Type (CVT type: city, village, general law township, charter township), and SquareMiles (area of each CVT). In addition, state, county and municipal FIPS codes are included.

Municipal Tax District

Shapefiles, .tiff and MrSID

Tags

taxation, boundaries, boundaries, tax authority, taxing, townships, municipal boundaries, corporate boundaries, cities, tax, villages, minor civil divisions

Summary

The primary purpose of this feature class is spatial analysis and cartographic output.

Description

A spatial representation of the local tax authorities. This polygon feature class was derived from the MunicipalDistrict feature class. It differs from the MunicipalDistrict feature class in areas where the tax authority differs from the legal authority. For example, two municipalities may have a 425 agreement in which an annexation does not occur, but the tax authority for certain parcels changes from one municipality to another. Key attributes include the Name (CVT name) and Type (CVT type: city, village, general law township, charter township), and CVTCode (unique code identifying the tax authority).

Oakland Schools

Summary

This feature class is primarily for the purpose of cartographic output and spatial analysis.

Description

A spatial representation of Oakland School District Boundary which represents the geographic area of all the local school districts that are governed by Oakland Schools. This polygon feature class was initially derived with data from the School District class. The key attribute is Name (the School District name).

School District

Shapefiles, .tiff and MrSID

Tags

school districts, boundaries, boundaries

Summary

This feature class is primarily for the purpose of cartographic output and spatial analysis.

Description

A spatial representation of school district boundaries. This polygon feature class was initially derived from the 1998 Parcel polygon feature class, based on a common school district code as maintained in the Oakland County Land Records database. The key attribute is Name (the school district name).

Special Tax District

Shapefiles, .tiff and MrSID

Tags

districts, planningCadastre, special tax districts, economy, economy, boundaries, boundaries, planningCadastre, special taxes

Summary

Oakland County's Planning and Economic Development Department uses this dataset for cartographic output. Oakland County's Treasurer's Office and Equalization Departments may use this dataset for spatial analysis.

Description

The SpecialTaxDistrict polygon feature class identifies many of the special tax districts represented in Oakland County. Provided by local CVTs, the special tax districts were created using legal descriptions, maps, or a list of the tax parcel number located within the special tax district. When no description was provided, the school tax code from the parcel attributes was used. The feature class was based on tax parcels, municipal districts and Oakland County roads. The key attributes are Name (the name of the special tax district) and Type (the type of the special tax district).

SUPPLEMENTAL INFORMATION

This feature class of overlapping polygons contains representations of special tax districts in Oakland County. There are up to 16 different types of special tax districts. Six special tax districts are currently mapped in this feature class. Others may be mapped in the future. The following rules were used in creating the data: Legal descriptions were followed, even if they bisected a tax parcel. A tax parcel must be completely within the special tax district boundary to participate in the district. Therefore, if the tax parcel is bisected by the boundary, it does not participate in the district. Right-of-way was included only if described in a description of the district, shown on an included map, or if the right-of-way was surrounded by parcels included in the description of the district. Separate polygons were created for districts that crossed CVT boundaries, even if they had the same school tax code. Separate polygons were created based on school tax code, if a described district consisted of more than one school tax code within one CVT.

Lineage ►

PROCESS STEP

► **DESCRIPTION** In August, 2003, these 2 feature classes were combined into one feature class and incorporated into the AdministrativeAreas data model.

Hide Process step ▲

PROCESS STEP

► **DESCRIPTION** In a new personal geodatabase, a new polygon feature class (using Oakland County spatial reference information) was created.

Hide Process step ▲

PROCESS STEP

► **DESCRIPTION** The new SpecialTaxDistrict feature class was compared to the DDA and TIFA geodatabase feature classes provided by Planning and Economical Development.

Hide Process step ▲

PROCESS STEP

► **DESCRIPTION** To match the standards in the DataModelGuide, fields were added or renamed, and field contents were converted from uppercase to title case.

Hide Process step ▲

PROCESS STEP

► **DESCRIPTION** In April, 2004, the SpecialTaxDistrict feature class was recreated. Using different types of documentation sent into the Oakland County Treasurer's Office from the local CVTs such as legal descriptions of a special tax district, maps of the special tax district, or a list of tax parcel numbers located within the special tax district. When no description was provided, the school tax code from the parcel attributes was used. Descriptions, maps, and tax parcel numbers were also sent in directly to the GIS Utility from CVTs and the Oakland County Equalization department. The following design decisiond were used when creating the data: There is an unwritten rule that a TIFA boundary extends from a TIFA tax parcel to half of all of the adjacent right-of-way. However, during construction of the feature class, this rule was not followed. Instead right-of-way was included only if described in a description of the special tax district, shown on an included map, or if the right-of-way was surrounded by parcels included in the description of the special tax district. The decision was made to create separate polygons for special tax districts that crossed CVT boundaries, even if they had the same school tax code. The decision was made to create separate polygons based on school tax code, if a described special tax district consisted of more than one school tax code. The decision was made to follow the legal description,

even if it meant a tax parcel would be bisected.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Oakland County's Tax Parcel feature class in ArcSDE was joined to the ParcelAttribute table. Using the "SCHDESC" field, the parcels with special school tax codes were selected (these are school tax codes that are did not end in a zero). The selected records were copied and pasted into the new feature class (with Oakland County's spatial reference information already assigned) within the new personal geodatabase. The parcels were merged together into one (single or multi-part) shape based on the same school tax code and the attributes of each special tax district were populated with name and type.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION This feature class was originally created in February, 2003, by the Oakland County's Planning and Economic Development Department. It contained two personal geodatabases, one for DDA districts and TIFA districts. They were created to use for mapping purposes.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Contact information found in the DDA and TIFA geodatabase feature class provided by Planning and Economical Development were added into the feature class.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Using information provided by the CVTs, such as legal descriptions of a special tax district, maps of the special tax district, or a list of tax parcel numbers located within the special tax district, the new special tax district were mapped out or a polygon created earlier was edited to match this new description boundary. If an area of right-of-way was not described in a description of the special tax district or shown on an included map, the right-of-way was not included. However, if the parcels included in the description of the special tax district surround the right-of-way, the right-of-way was included in the district.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION In August, 2006, the following types of Special Tax Districts were moved from this feature class to the DevelopmentAuthority feature class that will be maintained by Planning and Economic Development: 1. Brownfield Redevelopment Authority 2. Downtown Development Authority 3. Local Development Finance Authority 4. Tax Increment Finance Authority

State House District

Shapefiles, .tiff and MrSID

Tags

districts, state house, boundaries, boundaries, vote, representatives

Summary

The main user of this feature class is the Register of Deeds Office, who uses the data mainly for cartographic output.

Description

The StateHouseDistrict polygon feature class shows where the Michigan State House Districts are located in Oakland County. The Representative name is included in this file as well. The feature class was originally created as a coverage by the Register of Deeds Office using Oakland County's roads, municipal districts, and parcels. In June, 2003, it was brought into a geodatabase and has been maintained as a geodatabase since that time.

State Senate District

Shapefiles, .tiff and MrSID

Tags

districts, state senate, boundaries, boundaries, senate, representative, vote

Summary

The Register of Deeds Office uses this data for cartographic output.

Description

The StateSenateDistrict polygon feature class shows where the Michigan State Senate Districts are located in Oakland County. The feature class was originally created as a coverage by the Register of Deeds Office using Oakland County's roads, municipal districts, and parcels. In June, 2003, it was brought into a geodatabase and has been maintained as a geodatabase since that time. The key attribute is SenatorName.

Voting Precinct

Shapefiles, .tiff and MrSID

Tags

boundaries, boundaries, precincts, vote, voting

Summary

The Register of Deeds Office uses this data for cartographic output.

Description

The VotingPrecinct polygon feature class identifies the voting district into which every parcel falls. Legal descriptions of the voting precincts must be supplied by each municipality to the County Clerk, who then passes the information on to the State. The initial coverage was created by using Oakland County's roads, parcels, and municipal districts. The key attributes are Precinct (the precinct number) and Name (the name of the municipality to which the voting precinct belongs).

Zip Code Area

Shapefiles, .tiff and MrSID

Tags

boundaries, boundaries, zips, boundary, administrative, zip codes

Summary

The main purpose of this feature class is for cartographic output. Analysis can be done using this data. However, because not all boundaries were obtained from a legal description, detailed analysis is not recommended.

Description

This polygon feature class is an approximate representation of the 5-digit zip code areas in Oakland County. The boundaries were digitized based on legal descriptions from the US Postal Service. The date of the legal descriptions is unknown. Zip code areas for which a legal description could not be obtained were digitized using the zip code contained in the site address from the August, 2009 Oakland County tax parcel feature class. The key attribute is Zip.

PROCESS STEP

DESCRIPTION The remaining zip codes areas (24) had no legal description. The zip codes from the site addresses of the parcels as well as the boundaries of surrounding zip code areas were used as a guide to create these remaining boundaries. In cases where the zip code area appeared to be divided by a road, Oakland County's road centerline file was traced instead of the parcel boundary. Note that the zip codes in the parcels are not considered to be completely accurate. However, because no descriptions could be obtained from the Post Office, this was determined to be the best method of creating the remaining zip codes.

[Hide Process step ▲](#)

PROCESS STEP

WHEN THE PROCESS OCCURRED

INDETERMINATE DATE **unknown**

DESCRIPTION The official zip code descriptions were obtained from the US Post Office. Most descriptions came from the main Royal Oak post office.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION In August 2009, the zipcodes were updated based on zipcodes in the parcels and USPS databases this changed the outline of several boundaries such as 48335/48167, 48334/48025 and added 48033. The boundaries were also updated to follow parcel boundary lines, where possible, instead of the road centerline.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The coverage regions were imported into a personal geodatabase.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION 10 additional zip codes were added to the geodatabase using the descriptions provided by the USPS. Roads, CVT boundaries and hydrography lines or polygons were traced (using ArcMap's trace tool) whenever the description referred to them. The descriptions were used whenever possible. However, some descriptions referred to roads that did not exist. Or, the descriptions were generalized, and did not follow a road, CVT boundary or water feature (e.g., "south to the northwest corner of the village of Milford"). In these cases, the zip codes in the site address of the parcels were used as a guide to determine exactly how the boundary should be drawn.

[Hide Process step ▲](#)

PROCESS STEP

WHEN THE PROCESS OCCURRED

INDETERMINATE DATE unknown

DESCRIPTION Using parcels as a reference theme, approximately 34 of the zip code boundaries were created in a coverage.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Attributes such as DataSource, UserID, RevisionDate and Comments were added during the creation process and populated to track this information.

Tags

Assessment District, inlandWaters, S.A.D., inlandWaters, drain

Summary

This data provides detailed drain related information about maintained by the Oakland County Water Resource Commissioner's office.

Description

Drain Assessment Districts are being represented as polygon features. This process allows the City to construct infrastructure and make improvements for the safety, health, and welfare of its citizens. The City is reimbursed for the cost of the improvements, through the assessment process, by the owners of properties benefiting from the improvements. Key attributes include District Type and Drain Name.

PROCESS STEP

WHEN THE PROCESS OCCURRED **2000-01-01**

DESCRIPTION Stereo compiled from Oakland County's Digital Orthophotography 2000 flight at a scale of 1:1200. Visual QA checks were performed by cross checking the vector data against the imagery.

Hide Process step ▲

PROCESS STEP

DESCRIPTION This data has been updated on a daily basis by Oakland County Drain Commissioner's Staff since May 2008.

Hide Process step ▲

PROCESS STEP

DESCRIPTION Oakland County IT Staff imported the existing data, in the Oakland County hydrography model, into the new HydroDrain model. This new model supports both closed pipe and open ditch structures that carry water through the County.

Hide Process step ▲

PROCESS STEP

DESCRIPTION The waterways were migrated to the Oakland County hydrography model, which was based on a combination of ESRI's ArcHydro model, the NHDinGeo model, and the Oakland County Drain Commissioner's drain model

Hide Process step ▲

PROCESS STEP

DESCRIPTION Oakland County Drain Commissioner's Office updated attribute and geometry for features that depicted County Drains. Also, additional County Drains were added to the new HydroDrain model. Feature locations were derived from conversion efforts from compiling paper, digital and GPS data sources within the Drain Office.

ECF Neighborhood

Shapefiles, .tiff and MrSID

Tags

ecf, assessment, planningCadastre, planningCadastre, assessing, economic condition factor, parcels

Summary

The primary purpose of this dataset is to support feature based cartographic output for Assessors. The primary use of this dataset will be in an IMS Web Application.

Description

A spatial representation of a variation on the Tax Parcel feature class. This polygon feature class is created by a geoprocessing method that dissolves the Tax Parcel feature class on the Assessors' ECF Neighborhood Code in a joined Table. The result is a polygon feature class that shows the tax parcels stratified by the Assessor for each ECF Neighborhood.

SUPPLEMENTAL INFORMATION

ECF is an abbreviation of the term: Economic Condition Factor The ECF Parcel feature class is derived from the Tax Parcel feature class for the purpose of displaying which parcels exist in given ECF Neighborhoods. When displayed with a hollow fill, other thematic layers can identify for example, which parcels have sold within a certain ECF Neighborhood. Assessors from each assessing jurisdiction stratify properties that are influenced by similar market conditions - be they location, property type, condition, age as examples, and group them for analysis purposes. Periodically, as market conditions, or as properties no longer fit the conditions for an individual group - ECF districts are adjusted, reassigned, or new districts are created.

PROCESS STEP

DESCRIPTION The process was changed to pull data from the NeighborhoodCode field of the AssessorAttribute table rather than the ParcelAttribute table because the ParcelAttribute table contains the ECF value as of the previous year's tax roll. The AssessorAttribute table is updated weekly with current data for participating CVTs. Non-participating CVTs only send ECF data yearly.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Standard Dissolve GeoProcessing Wizard was performed on a field from a table joined to the tax parcel feature class. Data was then viewed for holes.

Land Code Table

Shapefiles, .tiff and MrSID

Tags

economy, economy

Summary

The primary purpose is for the assessor to develop land value maps for the State Tax Commission's 14 point review.

Description

This is a polygon feature class that represents a geographic area that shares the same land rate table. It could be a contiguous or noncontiguous area. The areas are determine by zoning, use, location, and perhaps parcel size (acreage vs platted lots, for example).

PROCESS STEP

DESCRIPTION A custom model was written that joins the AssessorAttribute table to the TaxParcel feature class on PIN/KeyPIN, respectively. All matching records are pulled out and copied to a temporary feature class. This feature class is then dissolved on the LandCodeTable and CVTTaxCode fields (multipart option used) to create the LandCodeTable feature class. This process is run weekly.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION A change was made to the process which creates the AssessorAttribute table to add a new field, LandCodeTable. The source of this field is the LandGateway (par_LandTable field in the eqparcel table). This field is only populated for the communities which participate in the Oakland County BSA Assessing system. The AssessorAttribute table is updated weekly.

Summary

This feature class was created to generate printed and online, interactive maps for the LinkMichigan project. It can also be used for other cartographic projects.

Description

This polygon feature class represents the wireless and DSL (digital subscriber line) provider coverage areas as circular polygons. Because the data was originally provided in shapefile by an outside vender in December, 2003, the methods used to create the data and the scale of the data collection are unknown. The key attributes are Provider (the name of the wireless or DSL service provider to which the equipped central office switch belongs), Type (the type of broadband service), RadiusFeet (displayed as either 14000 or 25000), and SwitchCode (a unique code given to each switch allowing the feature class to relate to the CentralOfficeSwitch feature class). This dataset was primarily created to support the LinkMichigan program. The LinkMichigan Regional Telecommunications Planning Program (LinkMichigan) was created to assist communities throughout the state in developing strategies for improving and expanding local telecommunications infrastructure and access. Oakland County is participating in LinkMichigan so that it can better understand its available telecommunications infrastructure and services, access and constituents' needs, thereby acting as a catalyst for improvements in economic development and overall quality of life.

PROCESS STEP

DESCRIPTION The BBradius.shp file contained circular polygons with no useable associated attributes. The BBradius.shp file appeared to be the result of a combination of two other shapefiles provided, DSL14KFT.shp and DSL5MI.shp. The DSL14KFT and DSL5MI shapefiles appear to be the result of a buffer of the points from the SwLoc.shp file, also provided by the vendor.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION An empty geodatabase was created with a new feature class. Four fields were added to the feature class. The first was given the field name "Provider", a data type of text and a length of 100. The second was given the field name "Type", a data type of short integer and a domain of BroadbandType. The domain set 1 = DSL and 2 = Wireless. The third was given the field name "SwitchCode", a data type of text and a length of 11. The fourth was given the field name "RadiusFeet", a data type of short integer and a domain of RadiusFeet. The domain set 1 = 14000 (ft) and 2 = 25000 (ft). The BBradius.shp file was then loaded into the personal geodatabase.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The radius feet field was corrected to reflect the domain.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The final feature class was compared to the shapefiles provided with the report.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The points in the SwLoc.shp file identify the physical location of an equipped central office switch for a wireless or DSL provider. The attributes associated with the points are COMPNAME, the name of the wireless or DSL service provider to which the equipped central office switch belongs; DSLRADFT, the radius that wireless or DSL is generally available within from an equipped central office switch; SWCITY, the city the switch is physically located in; SWITCH, a unique identifier for the switch; SWSTREET, the address location of the switch; and SWZIP, the zip the switch is physically located in.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The fields for the SwitchCode attribute were populated manually by referencing the points from the SwLoc.shp file.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION This feature class was created from two shapefiles, BBradius.shp and SwLoc.shp, provided along with a report by R. W. Beck, Inc. and Partner Communications LLC.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The UserID, Comments, and RevisionDate attributes were added on 2/25/04 according to the data modeling guidelines.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION After all the SwitchCodes were populated, a join was made between the new feature class, BroadbandServiceArea, and the SwLoc.shp based on the attributes SwitchCode and Switch, respectively. The Provider field was calculated from COMPNAME and the RadiusFeet field was calculated from DSLRADFT. The join was removed.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The feature class was mapped and provided to other IT staff and the vendor for review.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The maps were reviewed by other IT staff and the vendor.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The source for this feature class was a hardcopy map provided in a report by R. W. Beck, Inc. and Partner Communications LLC. The map contained the name of cable television providers and their corresponding coverage area in Oakland County. There was no other information available in the report that could be used to verify the location other than the map.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION A copy of the Oakland County municipal district feature class was made, and a Provider field was added to it (type Text, length 100).

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The UserID, Comments, and RevisionDate attributes were added on 2/25/04 according to the data modeling guidelines.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The polygons were then dissolved on the Provider attribute using the GeoProcessing Wizard. This created a new feature class which was renamed with the final name CableModemServiceArea.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Two additional cable modem service providers were added after a conference call with the vendor: Millenium Digital Media and WOW!

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Using information from the hardcopy map provided in the report, the Provider attribute was populated with the cable television provider's name.

Hide Process step ▲

PROCESS STEP

DESCRIPTION The final feature class was compared to the original map provided in the report.

gisvec1.OC.TornadoSiren

Shapefiles, .tiff and MrSID

Tags

tornado, structure, structure, tornado sirens

Summary

This feature class is mainly used for Oakland County maintenance purposes. For example, the Range attribute can be used to assess what areas of Oakland County can hear a tornado siren.

Description

This point feature class contains the location of tornado sirens. The feature class was created by digitizing the locations using the orthophotography and was originally created in approximately 1998. Because Oakland County maintains and installs the sirens, changes are made to the GIS as changes to the sirens occur.

Summary

The primary purpose of this data is for cartographic output. It can also be used to relate building-specific information (such as energy consumption reports).

Description

This polygon feature class represents buildings where Oakland County staff work. The buildings were digitized using the 2008 ortho imagery as a back drop. The key attributes are Name and BuildingNumber.

gisvec1.OC.WorkersCompensationClinic

Shapefiles, .tiff and MrSID

Tags

health, location, structure, clinic, clinics, medical, structure, facility, health, location

Summary

The Water Resources Commissioner's Office (OCWRC) requested this feature class for use by employees out in the field in order to locate the nearest facility to a particular job site. This feature class could also be utilized by other County departments.

Description

A spatial representation of facilities to be used by County employees for job related injuries. Oakland County Risk Management and Safety maintains and updates a hard copy list of facilities for use by County employees. These points were spatially located using heads-up digitizing and using Oakland County parcels, road centerlines, and current orthoimagery in July, 2015. The key attributes include the facility Name, Address, and Hours.

Credits

Facilities and Structures

gisvec1.OC.BoatLaunch

Shapefiles, .tiff and MrSID

Tags

inlandWaters, structure, transportation, transportation, boat, launch, launches, inlandWaters, structure, landing

Summary

The primary purpose of this feature class is to support Emergency Response and Preparedness. It is also useful for cartographic output.

Description

A spatial representation of boat launch facilities. This point feature class was created using heads-up digitizing with Oakland County's 2002 orthoimagery, road centerlines and WaterBody feature class as a reference. The key attributes include Name, StreetOrIntersection, Agency and Type.

structure, bridges, spillways, structure, culverts, headwalls, dams

Summary

The primary purpose of this feature class is a compilation of point features that are relative to the hydrography network in support of water resource management not limited to the Oakland County Drain Commission Project. This features class is also useful for spatial analysis and cartographic output. This is a preliminary version of bridge data. The features and attributes will be enhanced as time permits. This data was originally published within the HydrographyPoint feature class (Type = 1).

Description

A spatial representation of bridges found along the hydrography network. This point feature class was compiled at a scale of 1:1200 using Oakland County's 2000 orthophotography as a reference.

Shapefiles, .tiff and MrSID

Tags

structure, Higher Education, structure, High Schools, Technical Center, Middle School, Elementary

Summary

The primary purpose of this feature class is to support emergency response and preparedness. It is also useful for spatial analysis and cartographic output.

Description

A spatial representation of educational facilities (schools, colleges and technical centers). This point feature class was originally created by geocoding the facility address as provided by Oakland Schools and ERP to Oakland County's Road Centerline feature class. The resulting points were georeferenced to the facility structure using Oakland County's 2002 orthoimagery at a reference scale of 1:1200. In 2011, the process was revised. A list of educational facilities is download from the State of Michigan website under Center for Educational Performance and Information <https://cepi.state.mi.us/EEM/EntitySearchQuick.aspx> in July, 2015. This excel file is joined and compared to the existing feature class and unmatching records are removed or added as necessary. The key attributes include the facility Name, Address and Type (Elementary, Middle, High, Technical and College).

Shapefiles, .tiff and MrSID

Tags

structure, Mining, Gravel Pit, structure, Extractive

Summary

The primary purpose for this data is cartographic output. Specifically, it was created as a map product in the Oakland County One Stop Shop. This data can also be used for general planning purposes, as a historical record, and for potential analysis.

Description

A spatial representation of current and historic extractive sites using points. This data was digitized from a hard copy map from 1980 and 2003 and verified using orthophotography. The key attributes are the Status (Active, Not Active, or Redeveloped) and StatusDate.

SUPPLEMENTAL INFORMATION

This data was digitized from hard copy maps dated 1980 and 2003. During this process, historical and recent orthophotography was used to verify the accuracy of each site. Each point represents a general location of an extractive site. A site is defined as an area that is currently or was historically a distinct area of extraction. Furthermore, a site is never deleted from the dataset—rather, the status of the site is updated. This may result with what appears to be a distinct site in 2003 to be represented by multiple points. For example, if there were two sites of extraction in 1980, then each site would be represented by a single point. If by 2003 these sites expanded and merged into a single site, then the two original points would still be used to represent the site. Note: This data is limited to sites where extraction occurred for the primary purpose of obtaining raw materials. It does not include sites where land was excavated for the sole purpose of new development.

Fishing Location

Thumbnail Not Available

Tags

fishing, Waterbody, Biota, InlandWaters

Summary

The primary purpose of this feature class is to classify fishing locations within Oakland County of a recreational/educational nature. These lands are predominantly public lands available to all residents of the County.

Description

This point feature class was created in November, 2013, using a list of fishing locations from the Economic Development & Community Affairs department, as well as additional information from the State of Michigan DNR site. These locations were placed using heads-up digitizing with Oakland County's 2012 orthoimagery, boat launch, road centerlines and water body feature classes as a reference. The key attributes include Waterbody, AccessPoint, AccessFee, AgencyName and fields for the different fish.

Summary

The primary purpose of this dataset is to show a spatial representation of golf courses throughout the County.

Description

This feature class represents the location of golf courses in Oakland County using a point feature. The data was created by geocoding to parcels a list compiled from the Planning & Economic Development Division using the address information provided in the list. The list was compiled in May 2003. This process was revised in 2011. This dataset is not recreated each year. Instead it is verified and updated as necessary. In July, 2015, the existing feature class was compared to outside sources to verify if any updates or edits were necessary. Key attributes include name, address, and phone for each facility.

Administration Buildings, Court Buildings, Fire Departments, structure, Public Safety, Senior Center, Government Buildings, Post Office, Municipal Buildings, Police Departments

Summary

The primary purpose of this feature class is to support emergency response and preparedness. It is also useful for spatial analysis and cartographic output.

Description

A spatial representation of government facilities. This point feature class was created by geocoding the facility address, as provided by various sources, to Oakland County's Road Centerline feature class. The resulting points were then georeferenced to the facility structure using Oakland County's 2002 orthoimagery at a reference scale of 1:1200. This process was revised in 2011. This dataset is not recreated each year. Instead it is verified and updated as necessary. In July, 2015, the existing feature class was compared to outside sources to verify if any updates or edits are necessary. The key attributes include the facility Name, Address, and Type (Administrative, Police, Fire, etc.). Since this feature class represents Government facilities, those Post Offices represented in the Government feature class are post offices run by federal employees only and not approved postal providers for mail pickup and stamp sales.

High Population, structure, High Density, Apartments, structure

Summary

High density housing is useful in identifying high populations of residents for emergency responders and for cartographic output.

Description

This is a spatial representation of high density housing complexes such as apartments. The source of the data was the landfile data warehouse. Information was queried and extracted based on the landfile AI (apartment improved) use code. A point feature was created using the centroid of the parcel. The initial theme was created in fall of 2002. The scale was based on Oakland County's enterprise data. The process was revised in 2011, In July, 2015, an export from the Parcel Attribute table was joined and compared to the existing feature class and unmatching records are removed or added as necessary. Key attributes are Name, Address, and LocationMethod. The High Density Housing feature class does not contain senior houses, those are found under the Adult Care feature class.

Summary

This dataset was primarily created to support Oakland County's Department of Emergency Response and Preparedness, and to help in homeland security efforts across the County. The data was also expected to serve the needs of departments dealing with planning, marketing, and business development.

Description

This feature class represents the location of selected industrial facilities in Oakland County using a point feature. The data was created by geocoding to parcels a list provided by Oakland County's Emergency Response and Preparedness (ERP) Division using the address information provided in the list. The list was compiled in 2002 and has not been updated since. Key attributes include name and address for each facility.

SUPPLEMENTAL INFORMATION

This dataset was created from a list provided by Oakland County Emergency Response and Preparedness (ERP) Division. This list contained facilities that are part of larger companies that employed at least 10,000 people worldwide, or that produced a product necessary for human well-being or economic stability. The list contained the name of the facility and address. The address information was used to geocode to the parcel data along with the core attribute table. Facilities that didn't geocode automatically, were then geocoded to the street centerline data and moved to the parcel through verification. If a parcel for a facility couldn't be identified, the point was left as is, geocoded to the street centerline.

Summary

The primary purpose of this data is for cartographic output; specifically as a map product in the Oakland County One Stop Shop. This data can also be used by other county departments and CVTs for planning, emergency management and environmental management.

Description

A spatial representation of Current and Historic Landfill and Facility Sites using points. This data was digitized from a hard copy map dated 1991. This data was also updated and verified in 2007 by Oakland County Planning and Economic Development Services. The scale used for the development of the data collection is unknown. The key attributes include the name and type of each facility.

Winery, Christmas Tree, Native Plants, society, Brewery, Alpaca, farming, U-Pick, Farmer's Market, Meat, Distillery, Retail, Cider Mill, Community Supported Agriculture, Dairy, Honey, Orchard, CSA

Summary

The primary purpose of this feature class is to support spatial analysis and cartographic output.

Description

A spatial representation of local grown resources. This point feature class was created in November, 2013, by geocoding the address, as provided by various sources, to Oakland County's Road Centerline feature class. The resulting points were then georeferenced to the facility structure using Oakland County's 2012 orthoimagery at a reference scale of 1:1200. This dataset is not recreated each year. Instead it is verified and updated as necessary. In September, 2015, the existing feature class was compared to outside sources to verify if any updates or edits were necessary. The key attributes include the Name, Address, and Type (Farmer's Market, Honey, Retail, U-Pick, etc.).

Oakland County Parks

Shapefiles, .tiff and MrSID

Tags

recreation, society, planningCadastre, parks, planningCadastre, environment, environment, society

Summary

The purpose of this feature class is to identify lands within Oakland County that are considered park lands. These lands are predominantly public lands available to all residents of the County. This data is a subset of the the RecreationLand feature class.

Description

The Park feature class is a point subset of the RecreationLand feature class, extracted in January, 2014, to represent only those lands considered park land. The polygon RecreationLand feature class is a single county wide coverage containing recreation land and educational institution information compiled from several sources including: the State of Michigan, Oakland County Parks & Recreation, Oakland County cities, villages, and townships (CVTs), school districts, and the Huron-Clinton Metropolitan Authority (HCMA). Key attributes include: Name, Agency, Acres, and various activities associated with the feature.

Summary

The primary purpose of this feature class is to support Emergency Response and Preparedness. It is also useful for spatial analysis and cartographic output.

Description

A spatial representation of structures where persons of various religious denominations congregate. This point feature class was created using heads up digitizing with Oakland County's 2002 orthoimagery and Road Centerline feature class as a reference. The key attributes include the facility Name, Address and Type.

Summary

This feature class is used to identify beaches that require testing during a particular year. It is also used by the Health Department to assign interns to sampling areas.

Description

This point feature class represents the locations of public beaches that the Oakland County Health Department samples for the presence of E. coli. The beaches were digitized using Oakland County orthophotography that was likely from 1997. The date of the original digitizing is unknown. The data was updated on September, 2015, per ad hoc requested by Health sanitiers. The key attributes are BeachID and Name.

Lodging, Entertainment, Mall, structure, Hotel, Shopping

Summary

This dataset was primarily created to support Oakland County's Emergency Response and Preparedness Division, and to help in homeland security efforts across the County. The data was also expected to serve the needs of departments dealing with health, public safety, planning, etc.

Description

This feature class represents the location of recreational facilities (such as shopping centers, malls, hotels, and large entertainment venues) in Oakland County using a point feature. The data was created by geocoding to parcels a list compiled from the Oakland County Emergency Preparedness and Response Division using the address information provided in the list. The list was compiled in May 2002. This dataset is not recreated each year. Instead it is verified and updated as necessary. In August, 2015, the existing feature class was compared to outside sources to verify if any updates or edits were necessary. Key attributes include name, address, and phone for each facility.

SUPPLEMENTAL INFORMATION

This dataset was created from a list provided by Oakland County Emergency Response and Preparedness Division. The list contained the name of the facility and address. The address information was used to geocode to the parcel data along with the core attribute table. Facilities that didn't geocode automatically, were then geocoded to the street centerline data and moved to the parcel through verification. If a parcel for a facility couldn't be identified, the point was left as is, geocoded to the street centerline.

Summary

This coverage is part of a set of coverages included in the Oakland County Planning and Economic Development Services Historical & Cultural Resources Inventory mapping project. This data is used for cartographic output.

Description

This dataset, spatially represented as points, contains Oakland County's cemetery and crematorium site locations. This includes current and historic sites (no longer in existence). Reference information came from the United States Geological Survey 1:24,000 Quadrangle Maps, 1965-1991; Library of Michigan's Michigan Cemetery Atlas and Michigan Cemetery Source Book, the Illustrated Atlas of Oakland County Michigan, 1896; and The Atlas of Oakland County, Michigan, 1872. Key attributes include: Name, SiteLocation, and SourceComments

PROCESS STEP

► **DESCRIPTION** The information for the cemetery sites came from the United States Geological Survey 1:24,000 Quadrangle Maps, 1965-1991; Library of Michigan's Michigan Cemetery Atlas and Michigan Cemetery Source Book, the Illustrated Atlas of Oakland County Michigan, 1896; and The Atlas of Oakland County, Michigan, 1872. Extensive research was done using historic maps and aerial photography. Names of the cemeteries came mostly from the Michigan Cemetery Source Book. Family plots were given the name of the property owner at that time, though some are still designated as "Unknown." All historically known and current names of these cemeteries have been listed. Cross referencing of historic maps was used for verification. The features were originally digitized in MicroStation. The original files were converted to a shapefile and used in ArcView 3.x. In April 2004, the shapefile was imported into a personal geodatabase feature class for use in ArcGIS 8.x. At this time, each site location was checked against information contained within the county land file. To do so, the GIS tax parcel file was queried to find tax parcels where the name contained a value of "cemetery" or "cemetary". This led to the re-placement (location improvement) of a significant number of the cemetery sites. Oakland County's historic aerial photography was also used to identify the locations of several cemetery sites. For maintenance, new features will be geocoded using updated information contained in the county land file (GIS tax parcel file).

gisvec1.OC.CentennialFarm

Shapefiles, .tiff and MrSID

Tags

structure, farming, farming, planningCadastre, structure, planningCadastre, Centennial, Sesquicentennial, Agriculture

Summary

This dataset was developed to educate the public about a valuable and vanishing asset, in hopes of preserving those that are left. It is part of a set of coverages included in the Historical & Cultural Resources Inventory Mapping Project and can be utilized for cartographic output and spatial analysis.

Description

This dataset contains all known Oakland County centennial and sesquicentennial farms. Each feature, spatially represented as a polygon, was digitized using Oakland County's tax parcel layer. Location information came from the Centennial Farm Program of the Michigan State Historic Preservation Office and was verified using historic maps, aerial photography, and mailers to determine the direct relationship of the current owner to the original owner of the farm. Key attributes include FarmName, Owner, FarmStatus, PurchaseDate, and CertificationDate.

SUPPLEMENTAL INFORMATION

In order to have a farm certified as a Michigan Centennial Farm, the owner must submit the state application with photos and documents demonstrating that the farm meets the following qualifications: it must be 10 acres or more, still at least partially farmed, and owned by the same family for at least 100 years for centennial designation and 150 years for sesquicentennial designation. The relationship of the present owner to the original owner must be clearly stated. If at any time after designation as a Michigan Centennial or Sesquicentennial Farm, a farm fails to meet these requirements, it may be stripped of its designation.

PROCESS STEP

DESCRIPTION The original list of centennial & sesquicentennial farms came from the Centennial Farm Program for the State of Michigan. The information was entered into an MS Access database and each entry was verified using historic maps, aerial photography and mailers. Using ArcView 3.x, features were digitized using Oakland County's tax parcel fabric. Individual parcels were copied and placed into the shapefile representing the centennial or sesquicentennial farm. The features in the dataset are updated as the owner status and boundary definitions for the tax parcels change on an as needed basis.

Shapefiles, .tiff and MrSID

Tags

Detroit United Railway, Historic, Railroad, transportation, transportation

Summary

The primary purpose of this dataset is its inclusion in Oakland County's Historical & Cultural Resources Inventory Mapping Project. It is useful as an educational tool, in the hopes of assisting with the preservation of the County's historic and cultural resources. This information is used for spatial analysis and cartographic output.

Description

This dataset, spatially represented as lines, contains features depicting the railway segments that comprised the Detroit United Railway (DUR) at the time of its consolidation. Reference information came from several township-wide maps (of unknown scale) within the 1984 book titled When Eastern Michigan Rode the Rails, Schramm, Henning & Andrews, 1984. Key attribute is Name.

PROCESS STEP

DESCRIPTION The DUR features were originally digitized in Microstation from information contained on several township-wide maps (of unknown scale) within the 1984 book titled When Eastern Michigan Rode the Rails. Upon the release of ArcView 3.x, the original linework was converted to shapefile format. In April 2004, the linework was imported into a personal geodatabase feature class (ArcGIS 8.x) and manually realigned using several Oakland County base layers including existing road centerlines, railroad centerlines and 1963 digital orthophotography. Several railroad beds, especially in rural areas, were identified on the 1963 digital orthophotography that were interpreted to be the location of the original DUR lines. The linework imported from the shapefile to the geodatabase feature class was manually corrected to align with these features. Within urban areas, the DUR railroad lines were usually not visible on the 1963 orthophotography. Therefore, the assumption was made that the DUR lines were removed and the areas were most often paved over for automobile transportation (roadways). The linework imported from the shapefile to the geodatabase feature class was manually corrected to align with the road centerlines interpreted to now occupy the DUR rail location.

Summary

The primary purpose of this dataset is its inclusion in Oakland County's Historical & Cultural Resources Inventory mapping project. It is useful as an educational tool, in the hopes of assisting with the preservation of the County's historic and cultural resources. This information is used for cartographic output.

Description

This dataset, spatially represented as points, contains Oakland County's historic settlement locations, which includes once unincorporated places that are now incorporated (e.g., Holly, Rochester, and Lathrup Village). Reference information came from the Archeological Atlas of Oakland County, Michigan, 1931; the Illustrated Atlas of Oakland County Michigan, 1896; the book titled If This Is Hastings...Then Where Is Hog's Hollow?: A Discovery of the Lost Villages in Oakland and Macomb Counties, Deborah J. Remer, 1990; and various historic maps. Key attributes include: Type and Name

SUPPLEMENTAL INFORMATION

Many now incorporated areas went through numerous name changes over the past century. These name changes are reflected in the Name field, and each is separated with a forward slash ("/"). Not all currently incorporated areas are indicated in this dataset. Only areas that historically began as settlement and later became incorporated are represented. The Archeological Atlas of Michigan, by Wilbert T. Hinsdale, as part of the University Museum, University of Michigan, Michigan Handbook Series No. 4, 1931 is stored as part of "The Burton Collection" of historic maps housed in the main branch of the Detroit Public Library.

DESCRIPTION Reference information for this dataset came from the Archeological Atlas of Oakland County, Michigan, 1931; the Illustrated Atlas of Oakland County Michigan, 1896; the book titled "If This Is Hastings...Then Where Is Hog's Hollow?: A Discovery of the Lost Villages in Oakland and Macomb Counties", Deborah J. Remer, 1990; and various historic maps. Each point was digitized in a shapefile (ArcView 3.x) using Oakland County's tax parcels, road centerline and other layers for reference. The various names for each historic place, contained in the Name field, came from the sources listed above. In April 2004, the shapefile was imported into a personal geodatabase (ArcGIS 8.x).

Summary

The purpose of this dataset is to serve as an educational tool concerning the Native American history of Oakland County. It was developed as part of the Historical & Cultural Resources Inventory Mapping Project and is useful for spatial analysis and cartographic output.

Description

This dataset, spatially represented as points, contains four different types of features relating to Native Americans. Each point was digitized using features identified on a county-wide map (unknown scale) - Map No.6 of the Archeological Atlas of Michigan, by Wilbert B. Hinsdale, as part of the University Museum, University of Michigan, Michigan Handbook Series No. 4, 1931. Key attribute is Type.

DESCRIPTION The data was originally heads-up digitized in Microstation from information on a hard copy historic map - Map No. 6 of the Archaeological Atlas of Michigan, by Wilbert B. Hinsdale, Michigan Handbook Series No. 4, 1931. Upon the release of ArcView 3.x the points were converted to a shapefile format. Later, using ArcGIS, Map No. 6 was scanned and georeferenced and ultimately used to spatially adjust the point locations. The original points were manually realigned with the features indicated on the raster base map on screen. Although local archaeologists/anthropologists consider this map a reliable source, some locations of features indicated on the source map were not determined nearer than a section of land.

Summary

The purpose of this dataset is to serve as an educational tool concerning the Native American history of Oakland County. It was developed as part of the Historical & Cultural Resources Inventory Mapping Project and is useful for spatial analysis and cartographic output.

Description

This dataset, spatially represented as polygons, contains the only known or suspected Native American Reservations previously located in Oakland County. The features were digitized using information obtained from two sources. Boundaries for two of the features are shown on a county-wide map (unknown scale) - Map No.6 of the Archeological Atlas of Michigan, by Wilbert B. Hinsdale, as part of the University Museum, University of Michigan, Michigan Handbook Series No. 4, 1931. A third, nameless reservation, was identified in the Oakland County Book of History, 1970. Key attribute is Name.

SUPPLEMENTAL INFORMATION

The Archeological Atlas of Michigan, by Wilbert T. Hinsdale, as part of the University Museum, University of Michigan, Michigan Handbook Series No. 4, 1931, is stored as part of "The Burton Collection" of historic maps and housed in the main branch of the Detroit Public Library. The reservations are indicated on the historic maps as being property previously owned by the University of Michigan and donated for this purpose. Locational and previous ownership information for one of the reservations contained in this dataset came from the historic West Bloomfield geographic township map from the Surveyor Generals Office. Supplemental information for treaty dates and ownership of the reservation lands in the geographic township of Southfield can be found in the notes written on this historic map, on file in Oakland County Planning & Economic Development Services.

DESCRIPTION The data consists of three features originally digitized in ArcView 3.x and created using Oakland County's tax parcel fabric as a reference. Two features were created from information available on a historic map - Map No. 6 of the Archaeological Atlas of Michigan. The third (nameless) feature was created from information contained in the Oakland County Book of History. Each reservation was also cross-referenced using various historical books about Oakland County.

Tags

Path, Native American, society, Route, Indian, society, transportation, Trail, transportation

Summary

The purpose of this dataset is to serve as an educational tool concerning the Native American history of Oakland County. It was developed as part of the Historical & Cultural Resources Inventory Mapping Project and is useful for spatial analysis and cartographic output.

Description

This dataset, spatially represented as lines, contains historic Native American trail locations within Oakland County. Each line was digitized using features identified on a county-wide map (unknown scale) - Map No.6 of the Archeological Atlas of Michigan, by Wilbert B. Hinsdale, as part of the University Museum, University of Michigan, Michigan Handbook Series No. 4, 1931. Key attribute is Name.

PROCESS STEP

DESCRIPTION This data was originally digitized in Microstation from information contained on a hard copy historic map - Map No. 6 of the Archaeological Atlas of Michigan, by Wilbert B. Hinsdale, Michigan Handbook Series No. 4, 1931. The features were also verified (when applicable) with features identified on the historic geographic township maps of Joseph Wampler and Samuel Carpenter, Jr. developed as part of a contract with the General Surveyors Office between 1815 and 1823. On these maps some Native American trail locations are labeled as either "Indian Path" or "Path". Upon the release of ArcView 3.x, the linework was converted to shapefile format. In April 2004, Map No. 6 was scanned to create a digital image of the hardcopy. Using ArcGIS 8.x, the resulting digital image was georeferenced and ultimately used to spatially adjust the feature locations. The original linework was manually realigned with the features indicated on the raster base map on screen. Although local archaeologists/anthropologists consider this map a reliable source, some locations of features indicated on the source map were not determined nearer than a section of land.

Summary

The primary purpose of this dataset is its inclusion in Oakland County's Historical & Cultural Resources Inventory mapping project. It is useful as an educational tool, in the hopes of assisting with the preservation of the County's historic and cultural resources. This information is used for cartographic output.

Description

This dataset, spatially represented as points, contains Oakland County's registered historic sites. Each site was geocoded using reference information provided through the Michigan State Historic Preservation Office (SHPO) and the National Register of Historic Places (National Park Service) websites. Key attributes include: Name, Listing

SUPPLEMENTAL INFORMATION

General placement of points: Points that represent an individual structure are positioned directly on a structure that could be identified using our digital historic aerial photography resources. Points that represent a cemetery are positioned in a central area of the tax parcel containing the address for the cemetery site. Points that represent a historic district are placed in a central area of the district they represent. Two sites were identified on the National Register of Historic Places but were not included on the SHPO listing. They are (Name): Franklin Historic District (Boundary Increase) and Indian Lake Road Stone Arch Bridge. Additionally, two sites that were identified by SHPO as National Register Historic Places were not included in the listing provided through the National Register. It is possible these sites were removed from the National Register but updates have not made it to SHPO. They are (Name): 27460 California and 32 Oakland Park Blvd. National Historic Landmarks are the most significant of these historic places. Oakland County contains only one National Historic Landmark and that is Cranbrook. For more information on National Historical Landmarks, please visit: <http://www.cr.nps.gov/nhl/> The National Register of Historic Places has information available for districts, sites, buildings, structures, and other objects that are significant in American history, architecture, archeology, engineering, and culture. National Register listing is purely honorary and does not restrict what may or may not be done with a listed property unless federal funds are used. For more information about the National Register, please visit: <http://www.nr.nps.gov/> Michigan State Register of Historic Sites: Similar to the National Register, for a time it was possible to seek designation for buildings and sites on a separate State Register. While existing listings continue to be maintained, the State Register has been gradually phased out in favor of seeking listing on the National Register. For more information about the State Register, please visit: <http://www.mcgi.state.mi.us/hso/> Michigan Historical Markers: These are the large green metal markers that can be seen throughout the state and provide special recognition for buildings and sites of special historic significance. For more information about Michigan Historical Markers, please visit: <http://www.mcgi.state.mi.us/hso/>

PROCESS STEP

DESCRIPTION The features were originally digitized in MicroStation. The original files were converted to a shapefile and used in ArcView 3.x. In April 2004, the shapefile was imported into a personal geodatabase feature class for use in ArcGIS 8.x. The data was updated in December 2006. At this time, each site location was checked against information provided through the websites for the Michigan State Historic Preservation Office and the National Register of Historic Sites administered through the National Park Service. Using the address or location information provided from these sources, each location was verified against the county land file (GIS tax parcel file). Oakland County's historic aerial photography was also used to identify the locations of historic structures. This led to the re-placement (location improvement) of a significant number of the sites. General placement of points: Points that represent an individual structure are positioned directly on a structure that could be identified using our digital historic aerial photography resources. Points that represent a cemetery are positioned in a central area of the tax parcel containing the address for the cemetery site. Points that represent a historic district are placed in a central area of the district they represent.

Hydrography

gisvec1.OC.Dam

Shapefiles, .tiff and MrSID

Tags

structure, dam, lake level, inlandWaters, structure, inlandWaters, culverts, Control Structure, drain

Summary

This data provides drain related information about maintained by the Oakland County Water Resources Commissioner's office. The primary purpose of this feature class is a compilation of point features that are relative to the hydrography network in support of water resource management. This features class is also useful for spatial analysis and cartographic output.

Description

Dams are being represented as point features. A spatial representation of dams found along the hydrography network that generally serves the primary purpose of retaining water. The feature locations were derived from sub-meter GPS collected since the year 2000 and conversion efforts from paper and digital construction plans. Key attributes include AssetOwner, AssetMaintainer. Note: Null Field values mean the Data is not Available or Not Researched. NextDownID fields that equal -1 mean there is no feature downstream.

PROCESS STEP

DESCRIPTION Automated Hydro Tools populate and process the data in the HydroDrain data model on a weekly basis. The resulting data is published on an Enterprise ArcSDE server for use.

Hide Process step ▲

PROCESS STEP

DESCRIPTION Stereo compiled from Oakland County's Digital Orthophotography 2000 flight at a scale of 1:1200. Visual QA checks were performed by cross checking the vector data against the imagery.

Hide Process step ▲

PROCESS STEP

DESCRIPTION Oakland County Drain Commissioners Office updated attribute and geometry for features that depicted County Drains. Also, additional County Drains were added to the new HydroDrain model. Feature locations were derived from conversion efforts from compiling paper, digital and GPS data sources within the Drain Office.

Hide Process step ▲

PROCESS STEP

DESCRIPTION This data has been updated on a daily basis by Oakland County Drain Commissioner's Staff since May 2008.

Hide Process step ▲

PROCESS STEP

DESCRIPTION The waterways were migrated to the Oakland County hydrography model, which was based on a combination of ESRI's ArcHydro model, the NHDinGeo model, and the Oakland County Drain Commissioner's drain model.

Hide Process step ▲

PROCESS STEP

DESCRIPTION Oakland County IT Staff imported the existing data, in the Oakland County hydrography model, into the new HydroDrain model. This new model supports both closed pipe and open ditch structures that carry water through the County.

Summary

This data provides drain related information about maintained by the Oakland County Water Resource Commissioner's office.

Description

Drain control structures are being represented as line features. The Drain Control feature class represents dikes, that operate based on some measured condition in the drainage system. Key attributes include Asset maintainer, Drain Name and Feature Type.

Summary

This data provides detailed drain related information about maintained by the Oakland County Drain Commissioner's office.

Description

Network Drain Structures are being represented as point features. A Drain Structure is a structure such as a control or overflow structure. The feature locations were derived from sub-meter GPS collected since the year 2000 and conversion efforts from paper and digital construction plans. Key attributes include Feature Type, AssetType, AssetMaintainer. Note: Null Field values mean the Data is not Available or Not Researched. NextDownID fields that equal -1 means there is no feature downstream.

Summary

The primary purpose of this feature class is to support water resource management not limited to the Oakland County Water Resource Commission Project. This feature class is also useful for spatial analysis and cartographic output.

Description

Water Area is a spatial representation of polygonal hydrography features (Stream/River over 8 feet wide, Lake/Pond, Canal/Ditch, Swamp/Marsh). This polygon feature class was originally derived from a line coverage that was stereo-compiled as part of the Oakland County Spring 2000 digital orthophotography project. Key attributes include the ReachCode and the GNISID as defined in the the National Hydrography Dataset (NHD). Previously called Waterbody. Note: Null Field values mean the Data is not Available or Not Researched.

Summary

The primary purpose of this feature class is a compilation of linear features that participate in the hydrography network to support water resource management not limited to the Oakland County Water Resource Commission Project. This features class is also useful for spatial analysis and cartographic output.

Description

Water Course is a spatial representation of hydrography features (Stream/River, Lake/Pond, Canal/Ditch, Swamp/Marsh, Open Drains, Closed Drains, Non Gravity Drains and Siphons). The linear natural waterway features were stereo compiled at a scale of 1:1200 using Oakland County's 2000 orthophotography as a reference. Drain feature locations were derived from conversion efforts from paper and digital construction plans. Key attributes include the Asset Maintainer, ReachCode and the GNISID as defined in the the National Hydrography Dataset (NHD). Note: NextDownID fields that equal -1 means there is no feature downstream.

SUPPLEMENTAL INFORMATION

The hydrography features in this data set were stereo-compiled as part of the Oakland County Spring 2000 digital orthophotography project. They are topologically structured and compiled consistently with the direction of flow. All hydrography feature names were initially compiled from source materials maintained by the Oakland County Planning and Economic Development Services (PEDS) Division. These names are entered as they are commonly written; for example "Clinton River", "Orchard Lake" or "Lake Orion" and are stored in the Name attribute. Streams, rivers, canals and other linear hydrography features that are less than eight (8) feet wide have been compiled as a single line. When hydrography features are greater than eight (8) feet wide, the top of each bank has been compiled and the centerline has been interpreted for the purpose of maintaining linear topology. These centerlines, or "artificial pathways", are also placed through the center of polygonal water bodies to maintain linear topology. In addition, "connectors" are compiled to maintain network topology in cases where hydrography features travel under and/or through roads, bridges, culverts and structures. Each linear feature has a series of attributes. The ReachCode and GNISID were conflated from the NHD (National Hydrography Dataset). For more information on the NHD, refer to the USGS web site at <http://nhd.usgs.gov/techref.html>. A reach code is a numeric code that uniquely labels each reach. This 14-digit code has 2 parts: the first 8 digits are the hydrologic unit code for the cataloging unit in which the reach exists; the last 6 digits are assigned in sequential order, and arbitrarily among the reaches. Each reach code occurs only once throughout the Nation. Once assigned, a reach code is associated with its reach permanently. If a reach is deleted, its reach code is retired. A reach code should not be altered. The GNISID is an eight-digit identifier for names maintained in the Geographic Names Information System of the National Geographic Names Database. Starting in 2003, the original hydrography was remodeled using concepts contained in ESRI's ArcHydro geodatabase data model, OCDC Drain data model, and the NHDinGeo model. In Spring, 2004, the data was migrated into this new model. This document mainly describes the process used to create the geodatabase model, and migrate the data into the new model. Null Field values mean the Data is not Available or Not Researched.

PROCESSING ENVIRONMENT Microsoft Windows Server 2008 R2 Version 6.1 (Build 7601) Service Pack 1; Esri ArcGIS 10.1.1.3143

PROCESS STEP

DESCRIPTION Oakland County Drain Commissioner's Office updated attribute and geometry for features that depicted County Drains. Also, additional County Drains were added to the new HydroDrain model. Feature locations were derived from conversion efforts from compiling paper, digital and GPS data sources within the Drain Office.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Stereo compiled from Oakland County's Digital Orthophotography 2000 flight at a scale of 1:1200. Visual QA checks were performed by cross checking the vector data against the imagery.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Automated Hydro Tools populate and process the data in the HydroDrain data model on a weekly basis. The resulting data is published on an Enterprise ArcSDE server for use.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Oakland County IT Staff imported the existing data, in the Oakland County hydrography model, into the new HydroDrain model. This new model supports both closed pipe and open ditch structures that carry water through the County.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The waterways were migrated to the Oakland County hydrography model, which was based on a combination of ESRI's ArcHydro model, the NHDinGeo model, and the Oakland County Drain Commissioner's drain model.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION This data has been updated on a daily basis by Oakland County Drain Commissioner's Staff since May 2008.

gisvec1.OC.Watershed

Shapefiles, .tiff and MrSID

Tags

elevation, elevation, water, environment, watershed, environment

Summary

Can be used for spatial water resource analysis. Can also be used for cartographic output, though note that the boundaries have jagged edges.

Description

Watershed is a spatial representation of watersheds in Oakland County. Though the watersheds extend beyond the county boundary, they are clipped to follow the boundary. This polygon feature class was created by using DEMs. Different cell sizes were used for different watersheds.

[Hide Scope of quality information ▲](#)

[Hide Data Quality ▲](#)

Lineage ►

PROCESS STEP

► DESCRIPTION The dissolved polygons contained small holes and overlaps were located and eliminated in ArcMap by using topology rules and validation (no gaps, no overlaps).

[Hide Process step ▲](#)

PROCESS STEP

► DESCRIPTION A TIN was generated by using mass points, breaklines, hydrology polygons and a boundary polygon. This TIN was then converted to a DEM.

[Hide Process step ▲](#)

PROCESS STEP

► DESCRIPTION The watershed polygons were migrated to the Oakland County hydrography model, which was based on a combination of ESRI's ArcHydro model, the NHDinGeo model, and the Oakland County Drain Commissioner's drain model.

[Hide Process step ▲](#)

PROCESS STEP

► DESCRIPTION The ArcHydro functions were used to delineate watershed, which resulted in numerous catchments.

[Hide Process step ▲](#)

PROCESS STEP

► DESCRIPTION The Oakland County Drain Commission (OCDC) coded each catchment with the watershed that it belonged to. Once the coding was complete, the watersheds were dissolved based on the OCDC-added field.

[Hide Process step ▲](#)

PROCESS STEP

► DESCRIPTION Resulting polygons had small holes and overlaps, which were fixed by creating topology rules (no gaps, no overlaps), validating the topology, and fixing the errors in ArcMap. The polygons also did not perfectly follow the county boundary, so were adjusted to do so in ArcMap.

[Hide Process step ▲](#)

PROCESS STEP

► DESCRIPTION The watershed polygons didn't match the county boundary precisely. Those areas were located and fixed using topology rules and validation ("CountyArea" area boundary must be covered by boundary "Watershed").

gisvec1.OC.AcresRecorded

Shapefiles, .tiff and MrSID

Tags

acres, planningCadastre, planningCadastre, acreage, annotation

Summary

The primary purpose of this annotation feature class is for cartographic output.

Description

This annotation feature class contains the recorded acreage attribute from the TaxParcel feature class. Every TaxParcel polygon that contains a value in the AcresRecorded field should have a corresponding piece of annotation in this feature class. The feature class is not visible until the user is zoomed in to 1:6,000.

gisvec1.OC.ParcelBoundary

SDE Feature Class

Tags

planningCadastre, parcels, parcel, boundaries, meander lines, shorelines, COGO

Summary

The primary purpose of ParcelBoundary is to display all lines used in the creation of the TaxParcel feature class. This feature class can also be used to display acreage lines that are not part of the TaxParcel polygon feature class. These line will assist with cartographic output, as ParcelIdentification annotation can appear to "float" on the map without the acreage lines.

Description

The parcel boundaries are a line feature class that represent every line that may be used to comprise a lot or tax parcel. They are constructed from subdivision plats, condominium master deeds and their amendments, recorded and unrecorded surveys, and legal descriptions found within deeds. If public or private roads are noted on source documents, they are compiled, regardless of width. Any legal description that creates a division of land, recorded or unrecorded, must be approved by the local authority and submitted to the Equalization Division for permitting or taxation purposes. Most of the boundary information is compiled using coordinate geometry (COGO) based on geodetic control tied to the Public Land Survey System (PLSS) corner monuments. In some cases, boundaries are captured from features shown on digital orthophotography, such as shorelines. Other boundaries that cannot be constructed from coordinate geometry have been digitized from hard copy sources. The original parcel boundaries were converted from two CAD formats. Novi, Wixom, Rochester Hills, Rochester, Ferndale, Highland, and Waterford were converted from Genamap. The remainder of the County was converted from Microstation. In April, 2005, the lines were migrated into an ArcSDE versioned geodatabase editing environment.

Parcel Dimension

SDE Feature Class

Tags

dimensions, annotation, parcels, planningCadastre

Summary

The primary purpose of this feature class is for cartographic output.

Description

This annotation feature class contains the recorded and frontage dimensions related to the TaxParcel feature class, and the right of way widths related to the RightOfWay feature class. The recorded dimensions are found on recorded documents. They represent the dimensions of the platted land. The frontage dimensions are generally not found on recorded documents. They are the actual dimensions of the tax parcel along the road. The frontage dimensions are not present if there is a deflection in the frontage line. Acreage parcels also do not contain frontage dimensions. These dimensions are mainly used for assessing purposes. Right of way width dimensions are generally found on recorded documents. This feature class is not visible until the user is zoomed into 1:6,000.

gisvec1.OC.ParcelHistory

SDE Feature Class

Tags

parcels, vacations, retired, planningCadastre, history, planningCadastre

Summary

This data set is maintained primarily to support spatial and temporal analysis. It is also useful in support of the County's assessing and land management functions.

Description

A spatial representation of parcel history. This polygon feature class is created and maintained through the use of a customized tool for parcel maintenance management. As parcel splits and combinations create child parcels, the parent parcels are saved out to the parcel history feature class. Retired tax parcels have been maintained since 1998. Right of way and alley vacations are also maintained in this feature class. Vacations have been maintained since Spring, 2005. The key attributes include parcel identification number (KeyPIN) and the creation date (RevisionDate).

gisvec1.OC.ParcelIdentification

SDE Feature Class

Tags

annotation, PIN, parcel, lot, planningCadastre

Summary

The primary purpose of this feature class is for cartographic output.

Description

The Parcel Identification annotation feature class contains the KeyPIN value of the TaxParcel feature class as well as the Name from the SimultaneousConveyanceDivision feature class. This feature class is updated on a quarterly basis.

PIN Block

SDE Feature Class

Tags

There are no tags for this item.

Summary

A polygon feature class that supports feature based annotation for the left 7 characters of the Tax Parcel PIN.

Description

A spatial representation of a variation on the Tax Parcel feature class. This polygon feature class is created by a geoprocessing method that dissolves the Tax Parcel feature class on a truncated PIN value. The result is a feature based annotation layer which supports cartographic output similar to traditional tax assessment and land management mapping. The key attribute is PINBLOCK.

gisvec1.OC.RemonCenterStatus

Shapefiles, .tiff and MrSID

Tags

sections, planningCadastre, PLSS, planningCadastre

Summary

The primary purpose of this feature class is to report the status of the Oakland County Remonumentation Program as it relates to the redrawing of the Oakland County parcels.

Description

This polygon feature class is a spatial representation of Public Land Survey System (PLSS) sections. Each section is attributed with information related to the Oakland County Remonumentation Program, and how the Program impacts the redrawing of the Oakland County parcel data. Key attributes include CenterStatus and ParcelRedrawComplete.

SUPPLEMENTAL INFORMATION

The Oakland County Remonumentation Program is part of a State-mandated program. Funding for the program comes from the State. The program is required to close by the year 2011. Any dates beyond 2011 in the DateCenterAnticipated field are subject to the State approving the extension of the Remon program.

Summary

This feature class is primarily for the purpose of spatial analysis and cartographic output.

Description

A spatial representation of a subset of parcel features that contain special use characteristics. This polygon feature class is maintained in a geodatabase using topology with the TaxParcel feature class. The key attribute is AccessType, which describes the type of access (Prescriptive, Dedicated, or Private) on the feature.

PROCESS STEP

DESCRIPTION This polygon feature class was originally derived from an ArcINFO coverage using a geoprocessing method that dissolved features based on a common attribute. In this case, Parcel features were dissolved with adjacent Parcel features when the ROUCD attribute values are the same. In Spring, 2005, the coverage was migrated to the enterprise geodatabase. The RightOfWay feature class is now maintained in its own feature class, and topology is used to ensure coincidence with any surrounding geometry.

Simultaneous Conveyance

Shapefiles, .tiff and MrSID

Tags

subdivisions, planningCadastre, PUDs, planned urban developments, planningCadastre, plats, condominium plans

Summary

This feature class is primarily for the purpose of spatial analysis and cartographic output.

Description

A spatial representation of simultaneous conveyances (subdivisions and condominiums). This polygon feature class is maintained in an enterprise geodatabase using topology with other LandManagement feature classes. The key attributes include the name of the subdivision or condominium (Name) and the Oakland County Condominium Plan (OCCP) number, if present.

SUPPLEMENTAL INFORMATION

For the purpose of this document, simultaneous conveyances are subdivisions and condominiums. "A simultaneously created boundary results when several parcels of land are created in the same legal instant by the same person, persons, or agency and by the same instrument" (Brown, 1995, page 295). This polygon feature class represents the extent of the simultaneous conveyances as of the most recent recording.

SUPPLEMENTAL INFORMATION

Individual lot and unit boundaries are compiled for subdivision and site condominium developments. Site condominium plans may include building envelopes, general common elements, and limited common elements. Oakland County delineates limited common elements and labels these polygons with the appropriate tax number. For units without a limited common element, the building envelopes are mapped and labeled with the appropriate tax number. By contrast, building condominium plans have an associated set of building plans and the units that are delineated by the building plans are not mapped. For building condominiums, only the exterior boundary of the condominium plan is compiled. In all cases, general common elements are mapped and coded accordingly, unless it is also road, in which case it is coded as road.

Summary

This feature class is used as the reference data for two geocoding services, one that can geocode to the PIN number, and one that can geocode to the site address. This feature class is generally not recommended for cartographic purposes.

Description

This point feature class represents the center (not the true centroid) of each tax parcel polygon. The site address information is associated with each point that has a site address. Every point has a PIN (Parcel Identification Number) value. If there are multiple PINS associated with a particular tax parcel, the points are stacked on top of each other. If there are multiple site addresses associated with one PIN, these are stacked on top of each other as well. The points were created by a process that located the approximate center from the polygon feature class.

SUPPLEMENTAL INFORMATION

The original process used to create this file located the centroid of each parcel. However, the mathematical centroid can fall outside of a polygon's boundary. Therefore, a different process was used that would ensure the point would be located inside the polygon boundary. This process did produce some unexpected results, as the center of some parcels is not always located where a person might assume the center should be.

Tax Parcel

Shapefiles, .tiff and MrSID

Tags

planningCadastre, planningCadastre, Tax Parcels

Summary

This feature class was developed primarily in support of the County's parcel mapping needs which include assessment functions, spatial analysis and cartographic output. Among other custom applications, OakMap is also supported by this dataset. OakMap is a computerized information kiosk that provides easy, touch-screen access to County data.

Description

A spatial representation of Tax Parcels. Key attributes include KeyPIN. The KeyPIN is the unique parcel identification number used to link the tax parcel to the parcel attributes which are stored and maintained in Oakland County land records.

PROCESS STEP

DESCRIPTION The field ManyRelatedLandRecords was added to this feature class in November, 2006. The field was added so that users could quickly determine which parcels had many related records in the ParcelAttribute table. This field is updated weekly via a publishing script.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The TaxParcel feature class was migrated to an enterprise geodatabase in April, 2005. It is now maintained in its own feature class, and topology is used to ensure spatial coincidence with other land management layers.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Originally, this polygon feature class was derived from a geoprocessing method that dissolved features based on a common attribute value. In this case, Parcel features were dissolved with adjacent Parcel features when the PIN attribute values were the same.

Shapefiles, .tiff and MrSID

Tags

planningCadastre, planningCadastre, Tax Parcels

Summary

This feature class was developed primarily in support of the County's parcel mapping needs which include assessment functions, spatial analysis and cartographic output. Among other custom applications, OakMap is also supported by this dataset. OakMap is a computerized information kiosk that provides easy, touch-screen access to County data,

Description

A spatial representation of Tax Parcels that coincides with the Post March Board of Review Data Warehouse load. These are the 2003 tax parcel polygons as they existed for State Equalization of the 2004 Assessment Roll. This polygon feature class is derived from the Parcel polygon feature class, based on a common PIN value. Key attributes include Pin and PinFlag. The Pin is the unique parcel identification number (PIN) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County land records. The PinFlag is necessary to manage one-to-many occurrences between parcels and tax parcel identification numbers, (i.e. building condominiums).

Shapefiles, .tiff and MrSID

Tags

planningCadastre, planningCadastre, Tax Parcels

Summary

This feature class was developed primarily in support of the County's parcel mapping needs which include assessment functions, spatial analysis and cartographic output. Among other custom applications, OakMap is also supported by this dataset. OakMap is a computerized information kiosk that provides easy, touch-screen access to County data.

Description

A spatial representation of Tax Parcels that coincides with the Post March Board of Review Data Warehouse load. These are the 2006 tax parcel polygons as they existed for State Equalization of the 2007 Assessment Roll. This polygon feature class is replicated from the tax parcel polygon feature class. Key attributes include KeyPIN. The KeyPIN is the unique parcel identification number (PIN) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County land records.

Tags

planningCadastre, planningCadastre, Tax Parcels

Summary

This feature class was developed primarily in support of the County's parcel mapping needs which include assessment functions, spatial analysis and cartographic output. Among other custom applications, OakMap is also supported by this dataset. OakMap is a computerized information kiosk that provides easy, touch-screen access to County data.

Description

A spatial representation of Tax Parcels that coincides with the Post March Board of Review Land Gateway load. These are the 2009 tax parcel polygons as they existed for State Equalization of the 2010 Assessment Roll. This polygon feature class is replicated from the tax parcel polygon feature class. Key attributes include KeyPIN. The KeyPIN is the unique parcel identification number (PIN) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County land records.

planningCadastre, planningCadastre, Tax Parcels

Summary

This feature class was developed primarily in support of the County's parcel mapping needs which include assessment functions, spatial analysis and cartographic output.

Description

A spatial representation of Tax Parcels that coincides with the Post March Board of Review Land Gateway load. These are the 2012 tax parcel polygons as they existed for State Equalization of the 2013 Assessment Roll. This polygon feature class is replicated from the tax parcel polygon feature class. Key attributes include KeyPIN. The KeyPIN is the unique parcel identification number (PIN) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County land records.

Tax Parcel

Shapefiles, .tiff and MrSID

Tags

planningCadastre, planningCadastre, Tax Parcels

Summary

This feature class was developed primarily in support of the County's parcel mapping needs which include assessment functions, spatial analysis and cartographic output. Among other custom applications, OakMap is also supported by this dataset. OakMap is a computerized information kiosk that provides easy, touch-screen access to County data.

Description

A spatial representation of Tax Parcels. These are the 2014 tax parcel polygons as they existed for State Equalization of the 2015 Assessment Roll. This polygon feature class is replicated from the tax parcel polygon feature class. Key attributes include KeyPIN. The KeyPIN is the unique parcel identification number used to link the tax parcel to the parcel attributes which are stored and maintained in Oakland County land records.

Summary

The purpose of this information is to educate the public about our valuable natural resources, in the hopes of encouraging preservation. It is part of a set of coverages developed for the Historical & Cultural Resources Inventory Mapping Project and can be used for spatial analysis and cartographic output.

Description

This dataset, spatially represented as polygons, depicts Oakland County's distinguished natural features (legally dedicated Natural Areas and the only National Natural Landmark in the County). Reference information for the feature boundaries came from two hard-copy maps of unknown scale provided by the State of Michigan Department of Natural Resources (DNR). Each feature represented was digitized using Oakland County's tax parcels and orthophotography as reference. Key attributes include: Recognition, Name, and DesignationDate.

SUPPLEMENTAL INFORMATION

The Haven Hill Natural Area feature is recognized as both a legally dedicated natural area and a National Natural Landmark. However, the boundary definition of the area depicted as the Haven Hill State Natural Area is different than that of the National Natural Landmark. Natural Areas may be legally dedicated by State or Federal statute. The criteria to receive this designation includes: areas that have best retained their original landscapes and/or natural communities, such as open dunes, coastal marshes, prairies, savannas, primeval forests or scenic qualities, size and uniqueness. They must also contain ecological, geological, or other features of scientific, scenic or natural history value. These areas are dedicated under Public Act 451 of 1995, Article III Natural Resources Management, Part 351 Wilderness and Natural Areas (previously P.A. 241 of 1972), as either Wilderness, Wild, or Natural Areas. Dedication under the Wilderness and Natural Areas legislation represents the highest form of legal protection under state law for both public and private land in Michigan. To learn more about dedicated natural areas please visit the State of Michigan DNR webpage at: http://www.michigan.gov/dnr/0,1607,7-153-10367_11854---,00.html The National Natural Landmarks Program recognizes and encourages the conservation of outstanding examples of our country's natural history. It is the only natural areas program of national scope that identifies and recognizes the best examples of biological and geological features in both public and private ownership. National Natural Landmarks are designated by the Secretary of the Interior, with the owner's concurrence. The criteria used for this designation is essentially the same as that for a dedicated natural area, though this designation offers no legal protection. It is possible for a site to be both a Dedicated Natural Area and a National Natural Landmark.

PROCESS STEP

DESCRIPTION The features represented in this dataset were digitized in ArcGIS 8.x using Oakland County's tax parcel fabric and digital orthophotography as a base. Reference information used to create the legally dedicated natural area features was received from the State of Michigan Department of Natural Resources (DNR) and consisted of a hardcopy map of unknown scale. The map depicted each boundary plotted on top of aerial photography. The boundary definition representing the National Natural Landmark was also obtained from a hard-copy map provided by the State of Michigan DNR. This map consisted of a Xerox copy of a 7.5 minute Quadrangle topographic map showing a hand-drawn boundary for the area recognized as the landmark and originated from information provided to the DNR by the National Park Service.

Summary

This feature class is closely related to the HuronShiawaseeNaturalArea coverage also contained within the NaturalFeatures feature dataset. The purpose of this data is to provide detailed information (from ground survey) of some of the high quality natural areas within the project area. This layer is also useful for spatial analysis and cartographic output.

Description

A spatial representation (polygons) of the delineated natural community boundaries located within several natural areas identified as part of the Shiawasee Huron Headwaters Preservation Project. The features provide a site specific ecological summary generated through a field inventory. The S&H project area covers Rose, Springfield, Highland, White Lake, and Milford Townships. The MNFI staff started its inventory work using 1997 aerial photos covering the project area to identify possible high quality natural areas. Key attributes include vegetation type (Vegetation) and size (Acres).

PROCESS STEP

DESCRIPTION In 1997 the Steering Committee for the S&H Project contracted with the Michigan Natural Features Inventory (MNFI) to conduct a natural resources inventory of the project area. MNFI is a partnership between the Michigan Department of Natural Resources and The Nature Conservancy. MNFI staff includes biologists, botanists, and wildlife specialists. The MNFI staff started its inventory work using 1997 aerial photos covering the project area. This particular coverage was supplied to Oakland County PEDS by MNFI as a digital ArcView shapefile. Potentially significant natural areas were delineated based on the following criteria developed by the MNFI: 1. Size 2. Intactness 3. Upland and wetland complexes 4. Important riparian corridors within the respective watersheds 5. Large, contiguous forested tracts 6. Areas with potential for restoration Selection of individual site visits were determined by the Steering Committee who used the priority ranks and known growth pressures surrounding the natural areas.

Summary

The purpose of this coverage is to provide information regarding native landscape areas designated by the Michigan Natural Features Inventory (MNFI), in order to disseminate information on these locations to CVT's, state agencies, conservation groups, and those interested in natural and historic preservation. This layer is also useful for spatial analysis and cartographic output.

Description

A spatial representation of natural areas. The polygons contained in this feature class were derived from information provided by the Michigan Natural Features Inventory (MNFI). In 1986, using all available natural surveys and plant collections, aerial imagery dating back to 1937 and as current as 1986, and extensive field inventory, MNFI mapped the significant natural areas in hardcopy form. This information was provided to Oakland County's Planning Division and converted digitally using a digitizing tablet. Key attributes include the classification (in 1988) of property in which the native landscape resides (Owner1988), the suggested conservation action according to MNFI (SugConAct), and the geographic extent to which this resource is ecologically unique and significant, according to MNFI (Significance).

SUPPLEMENTAL INFORMATION

A "native landscape" is defined by MNFI as land areas supporting high quality native vegetation in a state similar to pre-European settlement. In 1986, the Oakland County Planning Division contracted with the MNFI staff to complete an inventory of the county's remaining natural areas. The inventory resulted in 37 distinct sites, totaling approximately 3000 acres containing many rare plant and animal species. A standardized, objective approach was implemented, utilizing an extensive set of evaluative criteria and a systematic methodology. These landscapes encompass natural features including fens, headwaters, forests, lakes, river valleys, marshes, bogs, etc.

PROCESS STEP

DESCRIPTION A substantial amount of work on the natural areas inventory was completed before any field work was done. First, all available natural surveys and plant collections were reviewed. Documents included the first major study of Oakland County's vegetation and natural communities completed by Marjorie Bingham in 1945, General Land Office surveys completed in the early 1800's, and other natural surveys prepared within the last fifteen years for Oakland Township and the Upper and Lower Clinton River watershed. Next, MNFI reviewed aerial photography dating back to 1937 and as current as 1986. Additionally, spring-time reconnaissance flights were performed where MNFI staff could see disturbed forests, invaded wetlands, and recently altered natural areas. Finally, MNFI staff performed site visits at each identified potential natural area. During ground survey, the presence of sensitive plants and animals was noted, the natural community boundaries were determined, natural quality and disturbances were recorded, species lists were compiled, soils were checked, and an overall evaluation was calculated. The field inventory data, including the natural community boundary information (hardcopy), was provided to Oakland County's Planning Division where it was converted digitally using a digitizing tablet.

Summary

The primary purpose of this data is to assist Oakland County Planning and Economic Development Services, local municipalities, land trusts, and other agencies in prioritizing conservation efforts and to help find opportunities to establish an open space system of linked natural areas throughout Oakland County. Specifically, this data serves as a resource for cartographic output and spatial analysis.

Description

A spatial representation of natural areas. The polygons contained in this feature class were derived from data developed for two separate projects, the Shiawassee & Huron Headwaters Resource Preservation Project and Oakland County Potential Conservation/Natural Areas Report. Each feature was assigned a rank of High, Medium, or Low. Digital Landcover, orthophotography, and USGS quadrangle maps were the main sources used to identify each natural area. Data collection from the Shiawassee & Huron Headwaters Resource Preservation Project began in 1997. The data from the Oakland County Potential Conservation/Natural Areas project was collected in 2001. Key attributes include Rank and Project. "Rank" is a reflection of quality and indicates the level of priority to retain or conserve the natural state of the identified area. "Project" identifies the project from which the feature was obtained.

SUPPLEMENTAL INFORMATION

Shiawassee & Huron Headwaters Resource Preservation Project - March 2000 Project Staff: Carlisle Wortman & Associates - Richard Carlisle, PCP, and Carey Nyberg Land Information Access Association - Joe VanderMeulen Michigan Natural Features Inventory - John Paskus Oakland County Planning & Economic Development Services - Bret C. Rasegan, RA, Charlotte P. Burckhardt, AICP, PCP, Lawrence S. Falardeau, RLA, Russell Lewis, RA, Leslie E. Kettren, AICP, Jim Keglovitz, and JoAnn Browning The Shiawassee and Huron Headwaters Resource Preservation Project involved six communities (Highland, Milford, Rose, Springfield, and White Lake Townships, and the Village of Milford) in western Oakland County. A Steering Committee composed of local officials, developers, property owners, and land conservancy members was the policy group that directed the project. The Steering Committee contracted with the Michigan Natural Features Inventory (MNFI) to identify potentially significant natural areas. Oakland County Potential Conservation/Natural Areas Report - July 2002 Prepared by: John Paskus, Associate Program Leader - Conservation Michael Penskar, Program Leader - Botany Helen Enander, Information Technologist I Michigan Natural Features Inventory P.O. Box 30444 8th Floor, Mason Bldg. Lansing, MI 48909-7944 This report identifies and ranks Potential Conservation Areas remaining in Oakland County. Potential Conservation Areas are defined as places on the landscape dominated by native vegetation that have various levels of potential for harboring high quality natural areas and unique natural features. In addition these areas may provide critical ecological services such as maintaining water quality and quantity, soil development and stabilization, pollination of cropland, wildlife travel corridors, stopover sites for migratory birds, sources of genetic diversity, and floodwater retention. However, the actual ecological value of these areas can only be truly ascertained through on the ground biological surveys. The process established by the Michigan Natural Features Inventory (MNFI) of identifying potential conservation areas, can also be used to update and track the status of these remaining sites. The site map and ranking data can be used by local municipalities, land trusts, and other agencies to prioritize conservation efforts and assist in finding opportunities to establish an open space system of linked natural areas throughout Oakland County. In this report the term "potential natural area" has been used in place of the term "potential conservation area". The substitution was made in order to convey to the reader a clearer picture of the type of sites that are being delineated. It is felt that more people have a better understanding of the term "natural area". The term "potential natural area", however, is not to be confused with the legal term "dedicated Natural Area" as described in Part 351, Wilderness and Natural Areas, of the Natural Resources and Environmental Protection Act of 1994 which gives land special legal protection.

DESCRIPTION When using this information it is important to keep in mind that site boundaries and ranking are a starting point and tend to be somewhat general in nature. Consequently, each community, group or individual using this information should determine what additional expertise is needed in order to establish more exact boundaries and the most appropriate conservation efforts. The features derived from the Shiawassee and Huron Headwaters Resource Preservation Project and the Oakland County Potential Conservation/Natural Areas Report were merged into a single feature class to provide a countywide dataset of potentially significant natural areas. The identification and data development process for features from either project is very similar. Therefore, only the methodology from the Oakland County Potential Conservation/Natural Areas Report project is detailed below. For specific information of the development process for features derived from the Shiawassee and Huron Headwaters Resource Preservation Project, please contact Oakland County's Planning and Economic Development Services. Materials and Interpretation Methodology: Interpretation of Oakland County was conducted by using digital aerial photography taken in 1997 & 2000 and provided by Oakland County's Planning and Economic Development Services Division. As the townships were methodically interpreted and digitized using this imagery, the same areas were examined using: - 1:24,000 U.S. Geological Survey (USGS) 7.5 minute quadrangle maps, - Michigan Resource Information System (MIRIS) 1978 digital landcover, and - Southeast Michigan Council of Governments (SEMCOG) 1995 digital landcover. These additional data sources were used to enhance and corroborate the interpretation process. Delineation of sites was done through aerial photo interpretation, with emphasis placed on 1) intactness, 2) wetlands and wetland complexes, 3) riparian corridors, and 4) forested tracts. Delineation of sites during this phase of the process was done conservatively, such that the chance of capturing sites that may end up being eliminated upon closer inspection, was greater than the chance of omitting sites

that should have been delineated. Sites were delineated by focusing on wetlands and forest tracts and eliminating as much development (including roads), active agriculture and old fields as possible. Boundaries typically were defined by hard edges such as roads, parking lots, developments, and railroad beds. All potential natural areas were identified and delineated regardless of size. Once all sites were delineated, sites under 20 acres were deleted. Site Selection and Prioritization: Following the aerial photo interpretation and the delineation of potential natural areas, a more rigorous level of examination was undertaken based upon specific scaled criteria to prioritize sites. Scaled criteria were developed that reflected the characteristics that were used to first delineate the sites. The criteria used to first delineate the sites were translated to a numerical scale. Each site could then be assessed based upon the scaled criteria and a total score calculated, based upon the sum of the scores for each criterion. Once the total scores were tabulated, the next step was to determine a logical and reasonable break between high priority, medium priority, and low priority sites. Many potential natural area sites can be just one point away from being placed into another category.

Summary

The primary purpose of this data is to assist Oakland County Planning and Economic Development Services, local municipalities, land trusts, and other agencies in prioritizing conservation efforts and to help find opportunities to establish an open space system of linked natural areas throughout Oakland County. Specifically, this data serves as a resource for cartographic output and spatial analysis.

Description

A spatial representation of potential natural areas. The polygons contained in this feature class were derived from data developed for the 2004 Oakland County Natural Areas Report update. Each feature was assigned a priority of One, Two, or Three. Digital Landcover, orthophotography, and USGS quadrangle maps were the main sources used to identify each natural area. The data from the Oakland County Natural Areas update project was collected in 2004. Key attributes include Priority and TotalScore. "Priority" is a reflection of quality and indicates the level of priority to retain or conserve the natural state of the identified area.

DESCRIPTION When using this information it is important to keep in mind that site boundaries and ranking are a starting point and tend to be somewhat general in nature. Consequently, each community, group or individual using this information should determine what additional expertise is needed in order to establish more exact boundaries and the most appropriate conservation efforts. Materials and Interpretation Methodology: Interpretation of the 25-township area in Oakland County was conducted by using digital aerial photography taken in 2002, Tax Parcel, and 2002 Oakland County Potential Conservation/Natural Areas provided by Oakland County's Planning and Economic Development Services Division. As the townships were methodically interpreted and digitized using this imagery, the same areas were examined using: Southeast Michigan Council of Governments (SEMCOG) 2000 digital landcover, Michigan Center for Geographic Information (MCGI) MI Geographic Framework Hydrography (v3b), and Michigan Natural Features Inventory (MNFI) Biotics Database. These additional data sources were used to enhance and corroborate the interpretation process. Delineation of sites was done through aerial photo interpretation, with emphasis placed on 1) intactness, 2) wetlands and wetland complexes, 3) riparian corridors, and 4) forested tracts. Delineation of sites during this phase of the process was done conservatively, such that the chance of capturing sites that may end up being eliminated upon closer inspection, was greater than the chance of omitting sites that should have been delineated. Sites were delineated by focusing on wetlands and forest tracts and eliminating as much development (including roads), active agriculture and old fields as possible. Boundaries typically were defined by hard edges such as roads, parking lots, developments, and railroad beds. All potential natural areas were identified and delineated regardless of size. Municipal boundaries were not utilized to delineate site boundaries unless the boundary corresponded to a defined hard edge, such as a road. Once all sites were delineated, sites under 20 acres were deleted. Following the aerial photo interpretation and the delineation of potential natural areas, a more rigorous level of examination was undertaken based upon specific scaled criteria to prioritize sites. The criteria used to first delineate the sites were translated to a numerical scale. Each site could then be assessed based upon the scaled criteria and a total calculated score, based upon the sum of the scores for each criterion.

Tags

farming, farming, economy, economy, biota, biota, environment, environment

Summary

The purpose of this coverage is to provide supplemental coverage of tree cover throughout the northern and western portions of Oakland County. It assists in the identification and establishment of locations of greenways and wildlife linkages. The dataset is also useful for spatial analysis and cartographic output.

Description

The natural tree row polygon layer was developed in the summer of 2000 with on-screen digitizing in ArcView, using the 1997 Oakland County digital Orthophotography and the 1995 Land Use/Land Cover coverage provided by the Southeastern Michigan Council of Governments (SEMCOG) as reference themes. Note: The southeast portion of the county (9 geographic townships) was excluded from this coverage. The key attribute associated with this coverage is "Acres".

gisvec1.OC.SurfaceGeology

Shapefiles, .tiff and MrSID

Tags

glacial geology, surficial geology, geoscientificInformation, geoscientificInformation, outwash, moraine, Oakland County, surface geology, glacial, geology

Summary

The primary business purpose for the development of this data set was to collaborate with the Cranbrook Institute of Science in producing an educational map about the surficial geology of Oakland County at a scale appropriate to Countywide and sub-County applications. Prior work by Farrand and Bell (1982) mapped surficial geology deposits of the entire state; however the data is too coarse to have meaningful application at a county and sub-County scale. An improved data set was created by combining Oakland's detailed digital topography with a more detailed geology map. Secondary business purposes include natural resources planning and environmental analysis. For example, this map was used to create an aquifer vulnerability map analysis as part of a countywide water resources study conducted by the United States Geological Survey.

Description

This polygon feature class represents the spatial extent of surficial geology deposits, glacial and sub-glacial drainage, and historical glacial lake shoreline areas in Oakland County. These features were captured using a combination of a surface TIN derived from 10-foot contours and a detailed original map of Oakland County surficial geology by Twenter and Knutilla, 1972. Polygons were delineated on a hard-copy map by John Zawiskie, Cranbrook geologist. The map was then scanned and registered to Oakland County GIS data. The polygons were digitized on-screen. Data was collected at approximately 1:1200; however the original map was produced at a countywide scale. The key attribute is the geologic sediment type.

Tags

location, property control corner, PLSS corner, location, NGS control, coordinate, coordinate value

Summary

The primary purpose of this feature class is to support the Remonumentation Program. In addition, this feature class lends itself to the horizontal accuracy of GIS data layers that reference it and it serves as the building blocks of the Parcel Framework.

Description

This point feature class is a spatial representation of all coordinate and monument information including NGS Control, PLSS Corners and Property Control Corners. Key attributes include ControlType and StationClass.

PLSS Boundary

Shapefiles, .tiff and MrSID

Tags

planningCadastre, PLSS, section lines, boundaries, boundaries, planningCadastre, quarter section lines

Summary

The primary purpose of this feature class is to compile the building blocks needed to construct the PLSSSection and PLSSQuarterSection feature classes.

Description

A spatial representation of Public Land Survey System (PLSS) boundaries. This linear feature class is derived from the PLSS corners. Heads up digitizing is used to construct these lines which must begin and end at a point that represents a PLSS corner. The key attributes are coordinate geometry (COGO) information including Angle and Distance. The attributes are populated using the ArcGIS Inverse tool.

PLSS Quarter Section

Shapefiles, .tiff and MrSID

Tags

planningCadastre, quarter sections, PLSS, planningCadastre

Summary

The primary purpose of this feature class is spatial analysis. It is also useful for cartographic output.

Description

A spatial representation of Public Land Survey System (PLSS) quarter sections. This polygon feature class is derived from the PLSSBoundary feature class. Key attributes include SectionCode and QuarterSection.

PLSS Township

Shapefiles, .tiff and MrSID

Tags

planningCadastre, PLSS, planningCadastre, townships

Summary

The primary purpose of this feature class is spatial analysis. It is also useful for cartographic output.

Description

A spatial representation of Public Land Survey System (PLSS) townships. This polygon feature class is derived from the PLSSSection feature class. Key attributes include TownshipNumber, TownshipDirection, RangeNumber, RangeDirection, AreaNumber and Name.

gisvec1.OC.CompositeMasterPlan

Shapefiles, .tiff and MrSID

Tags

Master Plan, planningCadastre, planningCadastre, Future Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local municipalities planning purposes. This includes cartographic output and analysis such as development potential, impervious surfaces, etc. This data was also created as product in the Oakland County One Stop Shop.

Description

A spatial representation of generalized Oakland County community master plans. These polygons were digitized from each of Oakland's 62 community's future land use map in their master plan. The data was completed in March of 2006 and will be updated as each community amends their plan. The key attribute is Composite Plan representing generalized, countywide future land uses.

For example, one community may have two commercial districts- Local Commercial and General Commercial. Another community may have three commercial districts- Neighborhood Commercial, Hi-Tech Office, and Retail Commercial. A wide range of uses could be included in these categories, but for the purpose of this feature class, they are all translated into "Commercial/Office." In some cases a category on community's future land use map could not be translated into a single composite category. When this occurred, areas were manually translated into the appropriate generalized category. For example, a Public Lands class on a community's map would be manually translated into the Public/Institutional and Recreation/Conservation composite categories.

PROCESS STEP

DESCRIPTION The data was digitized from each community's future land use map from their master plan. The base data was created from the Oakland County Tax Parcel and Right-Of-Use feature classes. Parcels were attributed with the future land use category to reflect the master plan. In cases where a parcel was interpreted to have multiple future land use designations, the parcel was split to reflect the boundary between the designations. Contact the Oakland County Planning and Economic Development Services Division

for more information regarding how the community's categories were translated into the composite categories. After it was digitized, the data was checked against the original master plan future land use map to verify its accuracy. As a final step, the base data was unioned with the Oakland County Waterbody feature class. The Master Plan and Composite Plan fields were updated to reflect those areas identified as water.

Summary

This purpose of this data is general planning purposes and cartographic output. This data can also be used in conjunction with the MNFI Natural Areas feature class to identify moderate to high quality natural areas that are not protected.

Description

A spatial representation of land that is protected from development by a Conservation Easement recorded with the State of Michigan. These points were manually placed to represent the location of a conservation easement using tax parcels and orthophotography as a reference. Each easement location and associated attribute information was found through a recorded document search using Access Oakland. Key attributes include: GrantorName, StartDate, AcresRecorded, Liber, and Page.

SUPPLEMENTAL INFORMATION

Each easement was located through @ccess Oakland, Oakland County's public records search tool. A search was conducted to find all recorded documents where the State of Michigan is the Grantee and the document type is an Easement (EST). In the Recorded Document Profile search within @ccess Oakland, three separate searches were performed to identify state recorded conservation easements: - "State of Mi" was entered as the "Grantor" and/or "Grantee" and "EST" was entered for the document type. This search was last performed 11/04/2003. - "Michigan Dep" was entered as the "Grantor" and/or "Grantee" and "EST" was entered for the document type. This search was last performed 11/04/2003. - "Department" was entered as the "Grantor" and/or "Grantee" and "EST" was entered for the document type. This search was last performed 11/04/2003. The legal description was used to identify the general location of the easement. Most often, these easements are created within a new residential development and may contain multiple conservation areas. In these cases, the point was placed in a general location within the subdivision to represent all the areas described in the conservation easement. The attribute information (i.e., GrantorName, StartDate, AcresRecorded, Liber, and Page) was also collected through @ccess Oakland. Once complete, the dataset was verified internally and checked against information obtained from the Michigan Department of Environment Quality. We contacted David R. Dortman from the Land and Water Management Division who provided a list of the easements the state had record of. The list contained the Grantor, Liber, Page, and Acreage.

special tax district, development, planningCadastre, boundaries, boundaries, planningCadastre, TIF, authority

Summary

The DevelopmentAuthority feature class is used by Oakland County Planning and Economic Development Services for cartographic output and analysis. It is used to support the Oakland County TIF ad hoc Review Committee and to support Oakland County downtowns. It is also used by Oakland County Equalization to determine the parcels where tax increment financing is captured by the authority.

Description

The DevelopmentAuthority polygon feature class identifies certain types of entities that encourage development/redevelopment in designated areas. This feature class currently represents Downtown Development Authorities (DDA), Tax Increment Finance Authorities (TIFA), and Local Development Finance Authorities (LDFA); however, it will also depict Corridor Improvement Authorities (CIA) and Brownfield Redevelopment Authorities (BRA) in the future. These five types of authorities have the ability to capture tax increment financing (TIF). The features were digitized using legal descriptions, parcel lists, and maps that were provided to the State of Michigan Office of the Great Seal and/or Oakland County Equalization by the authority. The key attributes are Name (official name of the authority), Type (the type of development authority), and DevelopmentPlan (yes/no indicating if the feature represents an area that is part of a development plan and can capture tax increment financing).

SUPPLEMENTAL INFORMATION

Tax Increment Financing is a tool used to promote redevelopment and community improvement projects by channeling funding toward projects in targeted areas. TIF is captured from the increase of property values from a base year. Millage rates from taxing jurisdictions are applied to the increased value. The resulting tax revenue is directed to the authority, rather than the appropriate jurisdiction. Beginning in 1994, taxing jurisdictions have the option to "opt out" of having its taxes captured by the authority. Also since 1994, school taxes may no longer be captured unless they are necessary to make payments on existing eligible obligations. For more information about TIF, see Michigan Department of Treasury's Tax Increment Financing FAQ web page at <http://www.michigan.gov/treasury/0,1607,7-121-3218--F,00.html>. The State of Michigan has adopted enabling legislation to allow TIF through five types of authorities. Each type of authority has a focus relating to development/redevelopment: Downtown Development Authority (PA 197 of 1975) * Correct and prevent deterioration in business districts * Encourage historic preservation * Promote economic growth of the districts Tax Increment Finance Authority (PA 450 of 1980) * Prevent urban deterioration * Encourage economic development and activity * Encourage neighborhood revitalization and historic preservation * Closed to new applicants since 1987 * Allows the development of virtually any type of land use Local Development Finance Authority (PA 281 of 1986) * Encourage local development * Promote conditions of employment * Promote economic growth * Limited to business activities involving: * Manufacturing * Agricultural processing * High-technology activities * Energy production * Business incubators Brownfield Redevelopment Authority (PA 381 of 1996) * Promote revitalization, redevelopment, and reuse of certain property * Focus on tax reverted, blighted, or functionally obsolete property * MDEQ must approve brownfield redevelopment areas Corridor Improvement Authority (PA 281 of 2005) * Correct and prevent deterioration in business districts * Encourage historic preservation * Promote economic growth of the districts * Must be adjacent to a road classified as an arterial or collector These quasi-public entities are created by resolution through a community's governing body. CIA and LDFA boundaries may cross municipal boundaries. In the case of these multi-jurisdictional authorities, both communities must pass resolutions establishing authority. There is currently only one Joint LDFA (Cities of Southfield and Troy) and there are no CIAs in Oakland County. When the community establishes the authority, it must also define the geographic boundaries in which it will operate. DDAs and CIAs are authorized to levy and collect taxes through a special assessment on all properties within the authority boundary. After the authority and its boundaries are established, the authority creates a tax increment financing and development plan. The plan estimates the amount of tax increment financing that will be captured and lists specific projects on which it will be spent. It also defines the development area where the tax increment financing and projects will occur. The development area must be completely within the authority boundary; however, it may be coincident with the authority boundary. An authority may contain multiple development areas, each with its own development and tax increment financing plan. BRAs normally designate development areas as a one or two parcels for a specific development project, while the other types of authorities define development areas as a larger area. Also, LDFAs are only allowed to capture TIF from parcels in a permitted use, such as manufacturing. There may be both eligible and ineligible parcels within a development area; however, the ineligible parcels do not participate in TIF capture. The base year used to calculate the amount of tax increment financing is set when the development plan is adopted. If the development plan is expanded at a later date, the base year could be reset for the entire development area or the capture could be calculated using multiple base years. The source for the base year was the tax billing code used by Oakland County Equalization. When no tax billing code was available (for communities that don't use the county's assessing system), the community was contacted to obtain the base year. When two separate authorities overlap, each authority can establish overlapping development areas. The authority that first created the development area has first claim on tax increment financing capture. Authority boundaries are represented using multiple features when the development area is not coincident with the authority boundary. One feature represents the development area and a second feature represents the remainder of the authority district that is not part of the development area. Multiple features are also used to represent authorities that have multiple development areas or development areas that have multiple base years. Brownfield Redevelopment Authorities are unique in that the authority boundaries are generally defined as the entire municipality. For this reason, the non-development areas of BRA's have been excluded from this data. The following list shows communities in Oakland County that have established a BRA: City of Auburn Hills City of Birmingham City of Farmington City of Farmington Hills City of Ferndale City of Hazel Park Charter Township of Highland Village of Holly City of Madison Heights Village of Milford County of Oakland City of Oak Park City of Pontiac City of Rochester City of Rochester Hills Charter Twp of Royal Oak City of Royal Oak City of Southfield City of Troy Charter Township of Waterford Source documents for the boundary of each feature were obtained from the State of Michigan Office of the Great Seal, Oakland County Equalization, and the Oakland County Treasurer's office. These could be in the form of a legal description, parcel list, and/or map. For several boundaries, multiple sources were available and conflicted with each other. When this occurred, hierarchy was given to the legal description, then a parcel list, over the map, and the conflict is noted in the Comments field. However, if a parcel was shown in a parcel list, but not described in the authority based on the legal description, then it was still shown in the authority. It should also be noted that legal descriptions were not digitized using exact coordinate geometry. Instead, features were created by referencing the legal description to snap vertices to parcels, right-of-way, section corners, subdivisions, and lots. Features digitized from a legal description or map included road and railroad rights-of-way as it was described or shown in the document. For vague legal descriptions and parcel lists, right-of-way was addressed uniquely for each authority. Some source documents had statements that all or half of the surrounding right-of-way is to be included in the boundary, but some did not address right-of-way at all. In these cases, right-of-way was addressed distinctly for each authority based on the type of authority and the source documents with the method used recorded in the Comments field. The data will be updated on an "as needed" basis when authorities amend their development plans or new authorities are established. Oakland County Equalization and the Oakland County Treasurer's Office will notify and forward the source documents of necessary revisions to Oakland County Planning and Economic Development Services who is the custodian of the feature class. Communities will be contacted annually to verify that the districts have not changed without the knowledge of county departments. In particular, county departments may not be aware of BRA development projects when no TIF is captured. Lastly, because the tax parcel feature class is revised periodically and it is important for the

features to be coincident with the tax parcel feature class, the development authority feature class will also be updated annually to correct conflicts due to parcel shifting.

PROCESS STEP

DESCRIPTION Source documents for the boundary of each feature were obtained from the State of Michigan Office of the Great Seal, Oakland County Equalization, and the Oakland County Treasurer's office. These could be in the form of a legal description, parcel list, and/or map. It should be noted that legal descriptions were not digitized using exact coordinate geometry. Instead, features were created by referencing the legal description to snap vertices to parcels, right-of-way, section corners, subdivisions, and lots. The data was QAQC'd by comparing the digitized boundaries with the existing data from SpecialTaxDistrict and parcels known to be within the authority based on Oakland County Treasurer's Tax Increment Financing Reports.

Dog License

Shapefiles, .tiff and MrSID

Thumbnail Not Available

Tags

society, planningCadastre, planningCadastre

Summary

This feature class can be used to visualize the location of licensed dogs throughout the County. This information can be useful for planning purposes (e.g., locating new dog parks or vet clinics).

Description

This polygon feature class was created to show the location of licensed dogs in Oakland County, MI. The feature class contains the number of dogs on the parcel. A related table, DogLicenseAttribute, contains characteristics of each licensed dog.

SUPPLEMENTAL INFORMATION

The source of this data is the Animal Control licensing database. The database is queried for licenses that expire last year, in the current year, and in the next 2 years. The PIN is associated with the dog license in the database using an automated process, and may not accurately represent the location of the licensed dog.

PROCESS STEP

DESCRIPTION The Animal Control database is queried for the dog licenses that expire last year, this year, and in the next 2 years. If the same parcel contains more than one license for the same dog name, only the most recent record is used. The PINs associated with the records are then selected out of the TaxParcel feature class, and the number of dogs on each parcel is summarized. A related table containing more detailed information about each dog is also created, using the same source data. The data is automatically updated on a weekly basis.

Farmland Agreement

Shapefiles, .tiff and MrSID

Tags

Farming, Agriculture, PA 116, farming, Agreement, Development Rights, Farmland, Environment, environment

Summary

The primary purpose of this data is to provide a spatial record of these agreements. This data can also be used for general planning purposes and to assist the Oakland County Environmental Stewardship Group locate areas of potential preservation.

Description

A spatial representation of land that is currently protected by a Farmland Development Rights Agreement (commonly known as PA 116) with the State of Michigan. The sites were located by a recorded document search through @ccess Oakland. Polygons were created using parcels as a base when applicable and by using coordinate geometry to digitize the legal description associated with agreement. The key attributes include the start and end date of the agreement, the name of the initiator, and the liber/page of the recorded document.

SUPPLEMENTAL INFORMATION

Each agreement was located through @ccess Oakland, Oakland County's public records tool. A search was conducted to find all recorded documents where the State of Michigan is the Grantee and the document type is an Agreement. Each search result was verified to be a current Farmland Development Rights Agreement and was then digitized. When a parcel identification number (PIN) was available, the polygon was simply copied from the Tax Parcel Feature Class. If a PIN was not available, the polygon was created using coordinate geometry. If only part of a parcel is described in the legal description, then only that part is represented in the dataset. The attribute information was also collected from @ccess Oakland.

planningCadastre, planningCadastre, Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. The two major uses are cartographic output and creating summaries at various spatial extents. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. This polygon feature class was digitized at a scale of 1:15,000 from a 1966 land use map prepared by Oakland County Planning Commission. The key attribute is LandUse.

SUPPLEMENTAL INFORMATION

The intent of this feature class was to provide a very general representation of a hard copy 1966 land use map. The spatial accuracy and number of vertices used to represent each feature was limited by the intended purpose of the data. The land use features were heads-up digitized from a 1966 land use map that was scanned and georeferenced using each section corner as a control point. The features were digitized at a scale not greater than 1:15,000, one square-mile section at a time. After the entire county was completely digitized, the features were dissolved based on the Landuse. Right-of-Way was burned in to the final feature class using the following process. First, the current RoadCenterline feature class was modified to reflect roads in 1966 using the scanned 1966 land use map and 1963 orthophotography as a reference. Next, the road lines were buffered at specified distances based on the RoadCode attribute from RoadCenterline to create polygons. Major Roads were split into two types (Prescriptive Easement and Dedicated) based on if the adjacent property was platted prior to 1966. According to the Oakland County Register of Deeds, in 1966 Oakland County was recording documents in liber 120. For the purpose of this feature class it was assumed that simultaneous conveyances recorded in liber 120 or earlier existed in 1966. Major roads that intersected or were adjacent with these simultaneous conveyances were classified as Dedicated and the remainder of Major Roads were classified as a Prescriptive Easement. The buffer distances, representing half the total Right-of-Way width, used for each road code are listed below: Minor Road - 30 feet Major Road (Prescriptive Easement) - 33 feet Major Road (Dedicated) - 46.5 feet State Highway - 46.5 feet U.S. Highway - 46.5 feet Interstate - 60 feet feet These Right-of-Way widths generally approximate those that actually existed in 1966 and are not intended to indicate the exact width of a specific Right-of-Way. All areas completely surrounded by Right-of-Way such as between directions of travel of a boulevard or interstate or the area inside of a freeway interchange were manually attributed as Right-of-Way. Water features were burned in the final feature class using a modified version the of the Oakland County Waterbody feature class. This data was modified to reflect waterbodies in 1966 using the 1966 land use map and 1963 orthophotography as a reference. Lastly, the features that intersected community boundaries were split using the Identity tool to increase cartographic and analytic performance.

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2001. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

FIELD DESCRIPTION

Primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2002. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2002 version of land use was created using the 2001 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

LIST OF VALUES

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

planningCadastre, planningCadastre, Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2003. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2003 version of land use was created using the 2002 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

FIELD LANDUSE

FIELD DESCRIPTION

Primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

SUPPLEMENTAL INFORMATION

The 2004 version of land use was created using the 2003 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2005. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2005 version of land use was created using the 2004 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

FIELD LANDUSE

FIELD DESCRIPTION

Primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

SUPPLEMENTAL INFORMATION

The 2006 version of land use was created using the 2005 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for the 2006 update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE [Public/Institutional](#)

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE [Single Family, 14,000 to 43,559 sq. ft](#)

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE [Single Family, 5 to 9.9 acres](#)

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE [Agricultural](#)

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

planningCadastre, planningCadastre, Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2007. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2007 version of land use was created using the 2006 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for the 2007 update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

PROCESS STEP

▶ DESCRIPTION The land use information was derived primarily from assessing records and orthophotography. Approximately 80% of the parcels were automatically assigned a land use directly from the Use Code assigned by Oakland County Equalization or the local assessor. The remaining 20% were manually classified using orthophotography, ownership information, Recreation Land feature class, Government facilities feature class, and other miscellaneous reference datasets. The 2001 land use data was first verified internally, then a map was sent to each CVT requesting verification. However, because there was little change from 2006 to 2007, this data was only verified internally. Also, parcels with certain types of used codes were again manually verified with orthophotography and other reference during the 2007 update process.

LIST OF VALUES

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this

category.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

SUPPLEMENTAL INFORMATION

The 2008 version of land use was created using the 2007 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for the 2007 update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

► DESCRIPTION The land use information was derived primarily from assessing records and orthophotography. Approximately 80% of the parcels were automatically assigned a land use directly from the Use Code assigned by Oakland County Equalization or the local assessor. The remaining 20% were manually classified using orthophotography, ownership information, Recreation Land feature class, Government facilities feature class, and other miscellaneous reference datasets. The 2001 land use data was first verified internally, then a map was sent to each CVT requesting verification. However, because there was little change from 2007 to 2008, this data was only verified internally. Also, parcels with certain types of used codes were again manually verified with orthophotography and other reference during the 2008 update process.

FIELD DESCRIPTION

Primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE [Multiple Family](#)

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this

category.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Waterbody feature class.

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

planningCadastre, planningCadastre, Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2009. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2009 version of land use was created using the 2008 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for this update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

LIST OF VALUES

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County WaterArea feature class.

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

SUPPLEMENTAL INFORMATION

The 2010 version of land use was created using the 2009 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for the 2010 update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

PROCESS STEP

▶ DESCRIPTION The land use information was derived primarily from assessing records and orthophotography. Approximately 80% of the parcels were automatically assigned a land use directly from the Use Code assigned by Oakland County Equalization or the local assessor. The remaining 20% were manually classified using orthophotography, ownership information, Recreation Land feature class, Government facilities feature class, and other miscellaneous reference datasets. The 2001 land use data was first verified internally, then a map was sent to each CVT requesting verification. However, because there was little change from 2009 to 2010, this data was only verified internally. Also, parcels with certain types of used codes were again manually verified with orthophotography and other reference during the 2010 update process.

FIELD **LANDUSE**

FIELD DESCRIPTION

Description of the code that represents the primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE **Single Family**, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE **Agricultural**

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE **Public/Institutional**

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County Area feature class.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

planningCadastre, planningCadastre, Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2011. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2011 version of land use was created using the 2010 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for this update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

VALUE **Agricultural**

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE **Single Family, 8,000 to 13,999 sq. ft.**

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE **Single Family, 1 to 2.5 acres**

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County WaterArea feature class.

FIELD DESCRIPTION

Primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels,

motels, campgrounds, and mobile home parks are not included in this category.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County WaterArea feature class.

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

Land Use 2013

SDE Feature Class

Tags

planningCadastre, Land Use

Summary

The primary purpose of this data is to be used by Oakland County Planning and Economic Development Services, other County departments, and local communities for planning purposes. This includes cartographic output and analyses such as buildout analysis, impervious surfaces, etc. This data was also created to be a product in the Oakland County One Stop Shop.

Description

A spatial representation of land use. The polygons contained in this feature class were derived from the Oakland County Tax Parcel feature class. Each parcel was categorized by its land use. When a parcel has multiple land uses, the dominant land use is shown. Assessing records and orthophotography were the main sources used to attribute each tax parcel with land use information. The data was collected in 2013. Key attributes are the land use and key pin (Sidwell number). Land Use stores the Land Use description for each parcel. The Key Pin is the unique Parcel Identification Number (Pin) used to link the parcel to the parcel attributes which are stored and maintained in Oakland County Land Records.

SUPPLEMENTAL INFORMATION

The 2014 version of land use was created using the 2013 version as a primary source. It was assumed that if the Parcel Identification Number and the Use Code were equal in both years, then the land use did not change. Thus, only the parcels where a change occurred had to be assigned a land use. To ensure the quality of the land use data, however, several types of use codes were manually checked again for this update to ensure the assigned use is still accurate. Also, reference data such as the Adult Care, Public Beach, and Recreation Land feature classes were used to locate misrepresented parcels. The development process consists of three basic steps. First, parcels with use codes that are assumed to relate to a single land use are categorized as such. Second, parcels with a use code that is assumed to relate to more than one land use are manually classified using orthophotography and ownership as a reference. Lastly, tax parcels, right-of-way, and hydrography are unioned to create a single land use dataset. Assumptions: In 2005, Oakland County Equalization and many of the local assessors have changed from using the use codes described below to property class codes. These codes were interpreted to similar use codes for the purpose of this data. One major change is that tax exempt property is no longer recorded using the "ME, Miscellaneous Exempt" use code, but are instead usually classified as "RV, Residential Vacant." The "Taxable" field was referenced to locate tax exempt property such as schools, churches, and government-owned property during this land use update. Any parcel classified as vacant may be an accessory use to an adjacent, commonly owned, improved parcel. In this event, the vacant parcel is reclassified as the use of the adjacent, commonly owned, improved parcel. It should be noted, however, that parcels with use codes of RV, SV, and LV, that represent a single family vacant use, are exempt from this assumption. Parcels with an Equalization use code of RV, SV, or LV may include uses to be reclassified as Vacant or Recreation & Conservation (due to subdivision open space). These parcels are not manually checked. Queries are conducted to search for those parcels that are subdivision open space. The following strings are queried from the Owner1 and Owner2 fields: "*own*" (unknown, homeowner), "ass*" (association, ass'n, etc), and "park." The Equalization use code BI, Business Improved includes uses that are reclassified as Commercial/Office. Uses may also fall into Public/Institutional, however, all BI parcels are not manually checked for reclassification. The Equalization use code MM, Miscellaneous Business includes uses that are reclassified as Recreation and Conservation, Multiple Family, Commercial/Office, or Mobile Home Park. The Equalization use code ME, Miscellaneous Exempt includes uses that are reclassified as Recreation & Conservation, Public/Institutional, Transportation, Utility & Communication, Industrial (municipal landfills), or any Single Family classification. The Equalization use code KI, Condominium Improved includes uses that are reclassified as Multiple Family, Single Family, or Commercial/Office. Any parcel with an Equalization use code of FI, Farm Improved or FV, Farm Vacant is considered to be an active agricultural use. Any parcel with an Equalization use code of II, Industrial Improved is considered to be an industrial use. Any parcel with an Equalization use code of FC, Farm Conservation is considered to be a recreational/conservation use. Any parcel with an Equalization use code of AI, Apartment Improved is considered to be a multiple family residential use. Any parcel with an Equalization use code of UI, Utility Improved is considered to be a transportation, utility, or communication related use. Parcels with an Equalization use code of DI, Developmental Improved are reclassified as Single Family or Vacant. Any parcel with an Equalization use code of DV for Developmental Vacant may be reclassified as Vacant, Recreation & Conservation, (golf courses) or Industrial (mining or extractive). Polygons in the ROW region of the parcel coverage will be classified as Recreation and Conservation, and Commercial/Office, Vacant, Road ROW, and Railroad ROW. Because of inconsistencies in Use Code data, unique uses, and the goal of creating an accurate coverage that is not limited by its metadata, there may be exceptions from these assumptions. Exceptions: There are nine isolated cases where the land use would be tremendously overstated if the whole parcel was shown in a single use. In these cases, the polygon was split to show the use of the rest of the parcel vacant. These parcels are listed below: 01-29-451-001 01-35-300-014 04-08-200-002 04-24-100-004 07-13-301-006 14-04-376-002 18-19-476-015 21-10-200-001 21-10-200-002

PROCESS STEP

DESCRIPTION The land use information was derived primarily from assessing records and orthophotography. Approximately 80% of the parcels were automatically assigned a land use directly from the Use Code assigned by Oakland County Equalization or the local assessor. The remaining 20% were manually classified using orthophotography, ownership information, Recreation Land feature class, Government facilities feature class, and other miscellaneous reference datasets. The 2001 land use data was first verified internally, then a map was sent to each CVT requesting verification. However, because there was little change from 2001 to 2014, this data was only verified internally. Also, parcels with certain types of used codes were again manually verified with orthophotography and other reference during the 2014 update process.

FIELD LANDUSE

FIELD DESCRIPTION

Primary display attribute defining the dominant land use of each parcel.

LIST OF VALUES

VALUE Commercial/Office

DESCRIPTION Improved parcels used for wholesale, retail, office, entertainment, or services, including those uses predominately at street level on multi-functional structures, plus related contiguous accessory uses such as parking areas and service drives.

VALUE Agricultural

DESCRIPTION Parcels used as cultivated farm land, orchards, nurseries, or for livestock or equestrian activity, with or without related farm structures.

VALUE Single Family, 8,000 to 13,999 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 1 to 2.5 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Public/Institutional

DESCRIPTION Improved parcels and facilities that are held in the public interest and are usually exempt from real property taxation plus any service drives or roads inside the actual parcel. Examples of this category are churches, educational facilities, governmental offices, hospitals, assisted living and skilled nursing care facilities, municipal parking facilities, day care centers, and cemeteries.

VALUE Single Family, More than one unit per parcel

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Railroad Right-of-way

DESCRIPTION Areas improved with a rail system and predominately used for train traffic.

VALUE Multiple Family

DESCRIPTION Improved parcels having four or more units per building in predominately residential use, including apartments, condominiums, row houses, senior living facilities without skilled nursing care, and terraces plus any streets, service drives, and community areas such as yards, clubhouses, and pools. Hotels, motels, campgrounds, and mobile home parks are not included in this category.

VALUE Industrial

DESCRIPTION Improved parcels used predominately for manufacturing or on which materials or articles are processed or semi-processed, but not retailed, including related storage areas, and warehousing. Commercial waste disposal sites, land fill operations, and junk yards are also shown as industrial.

VALUE Mobile Home Park

DESCRIPTION Improved parcels having multiple mobile home structures that are in the nature of a community or "mobile home park" plus any streets, service drives, and community areas such as yards, clubhouses, and pools. A single mobile home structure on a parcel is not classified as a mobile home, but "Single Family Residential."

VALUE Extractive

DESCRIPTION Parcels that are primarily used for surface mining and extraction of materials such as gravel, stone, minerals, ore, soil, or peat.

VALUE Recreation/Conservation

DESCRIPTION Parcels for which the primary purpose is for outdoor recreation or natural area conservation. This may include public or private-owned parks, outdoor sporting clubs, hunt clubs, golf courses, marinas, campgrounds, or areas for which the primary purpose is preservation and conservation of undeveloped natural areas.

VALUE Single Family, 10 acres or greater

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Vacant

DESCRIPTION All parcels not included in one of the above definitions. These are unimproved areas that are not in a committed use and not in a use that is accessory to an adjacent parcel with a use described above.

VALUE Transportation, Utility, and Communication

DESCRIPTION Improved parcels containing above or below-ground utility or communication facilities, including electric and gas generating plants, transmission lines, booster and transformer stations, related storage yards, county drains, detention/retention basins etc. In addition, airports, railroad yards, buildings related to utility companies, such as Detroit Edison, Consumer's Energy, and telecommunications companies, plus Waste Water Treatment Plants and Water Works, are also included in this category.

VALUE Single Family, 2.5 to 4.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, Less than 8,000 sq. ft.

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Single Family, 14,000 to 43,559 sq. ft

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Road Right-of-way

DESCRIPTION Areas that are predominately used for vehicular transportation. These areas may also contain pedestrian walkway, utility easements, railroad crossings, and/or on-street parking areas.

VALUE Single Family, 5 to 9.9 acres

DESCRIPTION Improved parcels having three or less units per building in predominately residential use. There are eight classifications of Single Family that are based on the parcel size (density).

VALUE Water

DESCRIPTION Areas that are ordinarily covered by water as depicted in the Oakland County WaterArea feature class.

Summary

The purpose of this coverage is to classify lands within Oakland County of a recreational/educational nature. These lands are predominantly public lands available to all residents of the County.

Description

The recreation lands coverage is a single county wide coverage containing recreation land and educational institution information compiled from several sources including: the State of Michigan, Oakland County Parks & Recreation, Oakland County cities, villages, and townships (CVTs), school districts, and the Huron-Clinton Metropolitan Authority (HCMA). Polygons of the parcels are used to represent the recreation/education lands. The hard copy source formats included listings, maps, and aerial photography. Key attributes include: Name, Agency, Acres, and various activities associated with the feature.

GISRAS1.OC.BW1940

Shapefiles, .tiff and MrSID

Tags

digital orthophotography, digital orthoimagery, aerial imagery, imageryBaseMapsEarthCover, historic, imageryBaseMapsEarthCover

Summary

The 1940 historic digital imagery serves as a highly accurate base map. Many GIS data layers such as surface hydrography or road edges can be used in conjunction with the imagery. Historic imagery can be used in environmental assessments and to visually communicate changes in development patterns and the implications of those changes on land use.

Description

The 1940 Historic Orthoimagery was derived from traditional orthophotography taken of Oakland County, Michigan. Original film negatives were cleaned, scanned, and raster digital files were created as TIF images. It is not known how the orthorectification, conversion or reprojection processes took place. This mosaic was created from a series of tiles stored in ERDAS Imagine format (IMG) in a Michigan State Plane South NAD83 International Feet projected coordinate system. Some tiles were missing from the IMG files used to create this mosaic, and one tile (XR-1A-109) did not have its respective world file. Therefore, some small gaps are present within the final dataset. The initial scale of the orthophotography is not known.

PROCESS STEP

DESCRIPTION ESRI ArcCatalog 9.3 was used to perform geoprocessing in order to create this mosaic dataset. Within ArcToolbox, a new empty raster dataset was created within an empty file geodatabase. From there, the Mosaic tool was employed to combine all of the IMG tiles (excluding the XR-1A-109 tile which did not contain a world file) into the empty raster dataset. In terms of Mosaic parameters, the Mosaic Operator was set to "Last"; the Mosaic Colormap Mode was set to "First"; the Ignore Background Value was set to "0"; the NoData Value was set to "0"; the Convert 1 bit data to 8 bit box was not checked; the Mosaicking Tolerance was set to "0"; and the Color Matching Method was set to "None". Upon creation of the new mosaic dataset from that process, the raster was subsequently loaded into ArcSDE.

GISRAS1.OC.BW1963

Shapefiles, .tiff and MrSID

Tags

digital orthophotography, DOP, digital orthoimagery, imageryBaseMapsEarthCover, imageryBaseMapsEarthCover

Summary

1963 historic digital imagery serves as a highly accurate base map. Many GIS data layers such as surface hydrography or road edges can be used in conjunction with the imagery. Historic imagery can be used in environmental assessments and to visually communicate changes in development patterns and the implications of those changes on land use.

Description

The 1963 Historic Orthoimagery was derived from traditional orthophotography. Images will be in raster format. Original film negatives were cleaned, scanned, and diapositives were created from these scans. The digital files were stored on DLT tape. Files were uploaded to workstations for rectification and mosaicing. ERDAS Imagine Orthobase software was used to create a seamless county wide image. Elevation data from the 1997 photography was used in this process. The original 1963 was flown of an altitude of 1"=1000'.

Tags

digital orthophotography, DOP, digital orthoimagery, imageryBaseMapsEarthCover, imageryBaseMapsEarthCover

Summary

1990 historic digital imagery serves as a highly accurate base map. Many GIS data layers such as surface hydrography or road edges can be used in conjunction with the imagery. Historic imagery can be used in environmental assessments and to visually communicate changes in development patterns and the implications of those changes on land use.

Description

The 1990 Historic Orthoimagery was derived from traditional orthophotography. Images will be in raster format. Original film negatives were cleaned, scanned, and diapositives were created from these scans. The digital files were stored on DLT tape. Files were uploaded to workstations for rectification and mosaicing. ERDAS Imagine Orthobase software was used to create a seamless county wide image. Elevation data from the 1997 photography was used in this process. The original 1990 was flown of an altitude of 1"=1000'.

Summary

This dataset is useful for feature extraction. It is also useful as a back drop or reference theme when analyzing vector datasets. Digital orthophotography can be used for cartographic output, as well.

Description

A black and white countywide photographic representation. The photography was collected in April, 1997 during "leaf off" conditions at an altitude of 15840 feet, resulting in a photo scale of 1" = 2640'. The pixel resolution is 18 inches.

Summary

This dataset is useful for feature extraction with a horizontal accuracy of +/- 2.5 feet at 100 scale. It is also useful as a back drop or reference theme when analyzing vector datasets. Digital orthophotography can be used for cartographic output, as well.

Description

A black and white photographic representation of Oakland County's least densely populated region. The photography was collected during "leaf off" conditions at a photo scale of 1:833, scanned, rectified and mosaiced to provide a seamless image. The native imagery has a 6 inch pixel resolution but was resampled to 12 inch pixels for this dataset. The more densely populated region of Oakland County is represented by 6 inch pixel resolution in a separate dataset.

SUPPLEMENTAL INFORMATION

This dataset is unique as compared to all other orthophotography flight years because the northwest region of the county was obtained with a higher resolution where there is less development in the interest of minimizing storage space and computer processing time. All control was based on the following: Horizontal datum: Michigan State Plane, Michigan South Zone; North American Datum: NAD83, in international feet Vertical datum: North American Vertical Datum 1988 (NAVD88), in international feet

Tags

digital orthophotography, DOP, digital orthoimagery, imageryBaseMapsEarthCover, imageryBaseMapsEarthCover

Summary

Digital orthoimagery offers imagery of any given area in the county. It also serves as a highly accurate base map that can be used to create other GIS data layers such as surface hydrography or road edges. Digital orthoimagery can also be used for cartographic output.

Description

Digital orthoimagery is a product of a fully digital process in contrast with traditional orthophotography. Digital aerial imagery is collected on magnetic tape then extracted when the mosaic is created. Oakland County's 2002 orthoimagery was collected during "leaf off" conditions at 10,000 ft. above ground level (AGL). The digital black and white imagery was rectified, and mosaiced to provide a seamless countywide image. The automated production process results in some image quality issues such as inconsistent tone balance, visible seam and mosaic lines. However these issues have no impact on the positional accuracy of the imagery.

digital orthoimagery, DOP, imageryBaseMapsEarthCover, digital orthophotography, imageryBaseMapsEarthCover

Summary

To provide countywide 6 inch pixel orthophotography for Oakland County's ongoing Geographic information systems development and to support various County business functions.

Description

This imagery is a black and white countywide dataset of Oakland County, Michigan. The imagery was collected in 4 flying days: 04/10/06, 04/11/06, 04/14/06, and 04/15/06 using a Z/I Imaging Digital Mapping Camera (DMC) digital aerial camera system. The flight altitude for the project was 4600 feet above mean terrain with a ground sample distance of .5 feet. Ayres Associates completed an aerotriangulation (AT) solution using Air Borne GPS data, surveyed ground control points, and IMU data. A fully analytical simultaneous least squares adjustment was completed for the entire block of aerial photography using Intergraph ISAT software. All AT processing was done on a digital photogrammetric workstation and the resulting AT solution is suitable for rectification of the aerial photography and supports ASPRS Class 1 mapping standards.

SUPPLEMENTAL INFORMATION

Oakland County provided all available County DTM data. Prior to digital orthoimagery production, the DTM data was reviewed and formatted for Ayres Associates systems. The existing DTM for the project required very little modification. In areas that did require modification a combination of stereo compilation and autocorrelation was used to update the DTM data. Autocorrelation is a process of comparing pixel values between overlapping aerial photos and assigning horizontal and vertical values to each pixel. Using an automated matching software Ayres Associates generated a grid of points (digital elevation model) suitable for ortho rectification. Stereo compilation was accomplished on digital photogrammetric workstations. Mapping technicians viewed imagery in a three dimensional environment. Photogrammetric software was used to collect terrain features as mass vertical points or breaklines on surface features. The resulting digital terrain information is suitable for ortho rectification. Using Intergraph digital orthophotography software, Ayres Associates rectified the imagery to the DTM surface. Bilinear re-sampling was used for all orthoimagery. To minimize building lean, achieve consistent tone across the project area, and to address the overlap between mosaics, all the imagery in the block was processed. Image mosaicking was accomplished by a combination of automated and manual methods. Manual image editing was completed to correct warped bridges and other rectification and mosaicking related issues. Finally tonal balancing was performed on individual tiles, as well as the project as a whole, eliminating the flight line effect. Orthophotography was delivered in 2500' x 2500' tiles in GeoTIFF format with a world file. In addition to the GeoTIFF files, Lizard tech MrSID files were delivered. The MrSID mosaics were delivered by Township with a compression ratio of 15:1. In addition, a countywide mosaic was delivered comprised of 2' pixels and a compression ratio of 30:1.

DOP, imageryBaseMapsEarthCover, digital orthophotography, imageryBaseMapsEarthCover, CIR, color infra red

Summary

This dataset is useful for delineating vegetation and impervious surface on a project wide basis, however. additional processing may be necessary to minimize tone balance issues.

Description

A color infra-red photographic representation of Oakland County. The photography was collected at a photo scale of 1" = 2640', scanned, rectified and mosaiced to provide a seamless image. The imagery was not subjected to tone balancing so when viewed at small scales, inconsistent tone is apparent. The pixel resolution is 18 inches.

GISRAS1.OC.DEM

Shapefiles, .tiff and MrSID

Tags

Michigan, Oakland County, Topography, DEM, Elevation, elevation, LAS, US, Digital Elevation Model, LiDAR, Surface Model

Summary

LIDAR data is used for 3D visualization, elevation based analysis and for feature extraction.

Description

This metadata supports the elevation raster (DEM grid) product derived from the 2008 LiDAR data set. The pixel elevation value is the slope elevation of the LiDAR ground surface at the pixel centroid. The 3 meter (9.84 ft) 32-bit float binary ArcGrids are cut to Oakland County township polygons. LIDAR data is remotely sensed high-resolution elevation data collected by an airborne collection platform. Using a combination of laser range finding, GPS positioning and inertial measurement technologies; LIDAR instruments are able to make highly detailed Digital Elevation Models (DEM) of the earth's terrain, man-made structures and vegetation. This data was collected at a resolution to aid in flood plain analysis and mapping.

SUPPLEMENTAL INFORMATION

These data represent the individual surface returns created by laser energy from the LiDAR sensor reflected from the first surface encountered by the laser pulse. Some energy may continue beyond this initial surface to be reflected by a subsequent surface as represented by the Last Return data. Intensity information is captured from the Reflective Surface pulse and indicates the relative energy returned to the sensor as compared to the energy transmitted. The Intensity image is not calibrated or normalized but indicates differences in energy absorption due to the interaction of the surface materials with laser energy at the wavelength transmitted by the sensor. Points are classified as water, bare ground or not bare ground to support creation of a bare earth model from the data.

DATA QUALITY REPORT - CONCEPTUAL CONSISTENCY ▶

MEASURE DESCRIPTION All LIDAR data are validated using commercial GIS software to ensure proper formatting and loading before delivery. This validation procedure ensures that data on delivery media is in correct physical format and is readable.

[Hide Data quality report - Conceptual consistency](#) ▲

DATA QUALITY REPORT - COMPLETENESS OMISSION ▶

MEASURE DESCRIPTION LIDAR raster data is visually inspected for completeness to ensure that any gaps between flight lines or loss of signal represents less than 5% of required collection area. LIDAR is self-illuminating and has minimal cloud penetration capability. Water vapor, steam plumes or particulates in smoke may cause reflection of LIDAR signals and loss of elevation information beneath these plumes. Glass structures and roofs may appear transparent to the LIDAR signal and therefore may not register on the reflective surface or if reflected, may cause multi-path ranging errors. Some asphalt formulations have been shown to absorb topographic LIDAR wavelength energy resulting in "pitting" of roof surfaces using this material.

[Hide Data quality report - Completeness omission](#) ▲

DATA QUALITY REPORT - ABSOLUTE EXTERNAL POSITIONAL ACCURACY ▶

DIMENSION horizontal

MEASURE DESCRIPTION Data collected is at a horizontal accuracy of 1 meter (RMSE) or better.

[Hide Data quality report - Absolute external positional accuracy ▲](#)

DATA QUALITY REPORT - ABSOLUTE EXTERNAL POSITIONAL ACCURACY ►
DIMENSION vertical

MEASURE DESCRIPTION LiDAR data accuracy determination shall employ the National Standard for Spatial Data Accuracy (NSSDA). Contracted to meet 18.5cm (RMSE) on open bare terrain and 37.0 cm (RMSE) in obscured "vegetative" areas at the 95 percent confidence level for data tested by an independent source of higher accuracy.

PROCESS STEP

WHEN THE PROCESS OCCURRED 2008-09-01

DESCRIPTION LAS bare earth to ASCII Raster elevation grid at 3 meter (9.84 ft) pixel size using LP360 (v.1.6.60) by QCoherent. Data was output by Township polygons provided by Oakland County.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Convert 3 meter (9.84 ft) ASCII Raster elevation grid to binary Arc Grid using ASCIIToRaster tool in ArcToolbox ArcInfo (v. 9.2).

[Hide Process step ▲](#)

PROCESS STEP

WHEN THE PROCESS OCCURRED 2008-08-01

DESCRIPTION LIDAR Ground Point Classification: The classification and quality control (QC) of LiDAR Ground point class is carried out using TerraScan software by Terrasolid Limited of Helsinki, Finland. In the filtering process points are classified as Default (1), Ground (2), Outlier, Noise or Low Point (7), Overlap (12)

[Hide Process step ▲](#)

PROCESS STEP

WHEN THE PROCESS OCCURRED 2008-01-01

DESCRIPTION Vendor Process Steps: Airborne GPS Processing: Airborne GPS data was differentially processed and integrated with the post processed IMU data to derive a smoothed best estimate of trajectory (SBET). The SBET was used to reduce the LiDAR slant range measurements to a raw reflective surface for each flight line. The overlap between flight lines was removed to provide a homogeneous coverage, and the coverage was classified to extract a bare earth digital elevation model (DEM). Airborne GPS is differentially processed using the GrafNAV V7.50 software by Waypoint Consulting of Calgary, Alberta, Canada. The PDOP and distance separation is as follows: IMU data is processed using the PosPac V4.2 software by Applanix Corporation of Richmond Hill, Ontario, Canada. The reflective surface is derived using the post processing software by Optech of Toronto, ON Canada. The classification and quality control (QC) of LiDAR data is carried out using TerraScan software by Terrasolid Limited of Helsinki, Finland. Oakland County Process Steps occurred post delivery: A county-wide DEM was created from 25 ArcGrids as delivered by the vendor. 1. Within ArcToolbox 9.3 the Mosaic to New Raster tool was used. a. Coordinate system was set to Oakland County spatial reference. b. Pixel Type was set to 8 bit unsigned c. Mosaic Method was set to First d. Mosaic Colormap mode was set to Blend 2. After county-wide mosaic was created ArcCatalog 9.3 was used to "Export Raster To Different Format" a. Output raster was set to a SDE location b. Defaults were accepted 3. Statistics were calculated on the county-wide DEM in SDE Lastly, for optimal viewing of DEM2008 in ArcMap change Statistics "From Each Raster Dataset" to "Current Display Extent" on the Symbology Tab within Properties.

0.3 meter orthoimage, Detroit, MI, natural color orthophoto, orthophoto, orthoimage, image map, US, rectified photograph, rectified image, MI, imageryBaseMapsEarthCover, imageryBaseMapsEarthCover

Summary

These data have been created as a result of the need for having geospatial data immediately available and easily accessible in order to enhance the capability of Federal, State, and local emergency responders, as well as plan for homeland security efforts.

Description

An orthoimage is remotely sensed image data in which displacement of features in the image caused by terrain relief and sensor orientation have been mathematically removed. Orthoimagery combines the image characteristics of a photograph with the geometric qualities of a map. For this dataset, the natural color orthoimages were produced at 0.3-meter pixel resolution (approximately 1-foot). The design accuracy is estimated not to exceed 3-meter diagonal RMSE (2.12m RMSE in X or Y). Each orthoimage provides imagery for a 1500- by 1500-meter block on the ground. The projected coordinate system is UTM with a NAD83 datum. There is no image overlap between adjacent files. The naming convention is based on the U.S. National Grid (USNG), taking the coordinates of the SW corner of the orthoimage.

DATA QUALITY REPORT - QUANTITATIVE ATTRIBUTE ACCURACY ►

MEASURE DESCRIPTION During photographic reproduction of the source photographs, limited analog dodging (radiometric editing) is performed to improve image quality. Analog dodging consists of holding back light from certain areas of the sensitized photographic material to avoid overexposure. The diapositive is inspected to ensure clarity and radiometric uniformity. Diapositive image brightness values are collected with a minimum of image quality manipulation. Image brightness values may deviate from the brightness values of the original images because of image value interpolation during the scanning and rectification processes. Radiometry is verified by visual inspection of the digital orthophoto with the original unrectified image to determine if the digital orthophoto has the same or better image quality as the original unrectified input image. Slight systematic radiometric differences can be detected between adjacent orthoimage files; these are due primarily to differences in source photograph capture dates and sun angles along flight lines when the aerial photographs were taken. These differences can be observed in an image's general lightness or darkness when it is compared to adjacent orthoimage file coverages. Tonal balancing may be performed over a group of images during the mosaicking process which may serve to lighten or darken adjacent images for better color tone matching.

[Hide Data quality report - Quantitative attribute accuracy ▲](#)

DATA QUALITY REPORT - ABSOLUTE EXTERNAL POSITIONAL ACCURACY ►
DIMENSION horizontal

MEASURE DESCRIPTION Forty-eight (48) quality control (QC) ground points were established throughout the project area. Five of the QC points were ground check points provided by USGS. Two of the QC points were at photo identifiable locations established by past Aerometric, Inc projects. Forty-one of the QC points were at well-defined locations established by reading their positions from model absolute orientations using the aerotriangulation solution as control. The locations of 48 QC ground points were compared to their positions on the rectified ortho images. The resulting X and Y residuals were used to calculate the NSSDA horizontal accuracy at the 95% confidence level in meters.

QUANTITATIVE TEST RESULTS
VALUE 0.654

EVALUATION METHOD Federal Geographic Data Committee, 1998, Geospatial Positioning Accuracy Standard, Part 3, National Standard for Spatial Data Accuracy, FGDC-STD-007.3-1998

Lineage ►

PROCESS STEP

WHEN THE PROCESS OCCURRED 2003-02-01

DESCRIPTION One thousand five hundred thirty-nine (1539) airborne GPS positions were provided by USGS and used as control in the aerotriangulation process. Five (5) ground checkpoints were also provided by USGS and used to verify the accuracy of the aerotriangulation. The scanned source imagery (21 micron) was provided by USGS. The scanned images were then used as input, along with airborne GPS data, ground check point data, and camera calibration data into a Z/I's ISAT software for point mensuration and aerotriangulation. Rectification was done using the aerotriangulation data, scans, and 30 meter DEM data provided by USGS. These rectified images were used to draw seamlines and QC the accuracy of the DEM. Areas of mismatched or warped imagery were noted and the DEM was viewed and edited in a softcopy environment. After rectifying these images, they were then dodged. The dodged rectified images were mosaicked, balanced, and cut into final image sheets. The final sheets were viewed and artifacts were removed.

Southeast Michigan, Aerial photography, elevation, ADS40, Digital Surface Model, imageryBaseMapsEarthCover, Digital Elevation Model, DEM, Air photos, Aerotriangulation, Imagery, GPro, DSM, Orthophotography, Digital Orthos

Summary

The Southeast Michigan Regional Orthoimagery Project was a coordinated effort to acquire digital orthoimagery in Spring 2005 for the entire seven county region. Southeast Michigan Council of Governments lead the partnership in cooperation with Livingston, Macomb, Monroe, Oakland, St. Clair, Washtenaw, and Wayne Counties, the State of Michigan, United States Geological Survey and the Detroit Water and Sewerage Department. The local cities, villages, and townships will benefit through their partnership with the counties. - Cost savings to partners through cost sharing and coordinated project management. -Cost savings through economies of scale by contracting with a single vendor. -Sharing the combined experiences of all partners, resulting in high-quality regional imagery for the same year. -Drawing from each county partner's expertise, staff resources, and ownership commitment, they will be responsible for their own QA/QC process using common standards and training. -Providing a partnership framework for future updates of imagery after 2005.

Description

Oakland County participated in the Southeast Michigan Regional Orthoimagery project encompassing approximately 5000 square miles, which includes an additional ½ mile buffer beyond the boundary of the seven county region. This extends approximately 500 feet into Canada. The orthoimagery is true color with a base pixel resolution of 6 inches for the County-only imagery, and 2' for the region-wide imagery. Orthoimagery tiles were delivered in Tiff format with Tiff world files representing ground dimensions of 2000' x 3000'. Tile naming convention includes the county code, the third and fourth digit of the lower left X and the first three digits of the lower Y coordinate and the year flown. For example 161 2005, tile name would be 1612932405). Countywide and community mosaics are saved in the MrSID format. Community MrSID files are compressed at 20 to 1 using the 6 inch pixel imagery and countywide MrSIDs are compressed at 50 to 1 using the 2 foot pixel imagery. All control was based on the following -Michigan State Plane (South) - Horizontal datum -North American Datum (NAD 83) international feet second-order class I. -Vertical datum - North American Vertical Datum 1988 (NAVD88) international feet, third-order class I. All imagery was taken in the spring of 2005. Acquisition was attempted when the ground was not obscured by haze, smoke, dust, clouds or cloud shadows, and snow or ice. Flights were scheduled when solar angle was at least 30 degrees or more above the horizon Orthoimagery complies with the American Society for Photogrammetry and Remote Sensing Accuracy Standards for Class 1 mapping requirements.

DATA QUALITY REPORT - CONCEPTUAL CONSISTENCY ►

MEASURE DESCRIPTION Compliance with the accuracy standard was ensured by the collection of photo identifiable GPS ground control after the acquisition of aerial imagery. The following checks were performed. 1. The ground control and airborne GPS data stream were validated through a fully analytical bundle aerotriangulation adjustment. The RMSE is less than 1, 10,000th of the flying height. 2. The DSM (for True Ortho areas) or DEM (for ground ortho areas) data was checked against the project control. The technician visited and confirmed the accuracy of the points during initial processing 3. Digital orthophotography was validated through an inspection of edge matching and visual inspection for image quality.

[Hide Data quality report - Conceptual consistency ▲](#)

DATA QUALITY REPORT - COMPLETENESS OMISSION ►

MEASURE DESCRIPTION The following methods are used to assure imagery accuracy. 1. Use of IMU (inertial measurement unit) and ground control network utilizing GPS techniques. 2. Use of airborne GPS (global positioning system) in conjunction with the acquisition of imagery. The following software is used for validation of the imagery and surface modeling 1. Aerotriangulation - GPro and ISTAR 2. DSM and DEM data - GPro and ISTAR 3. Digital Orthophotography - ISTAR 4. Bentley - MicroStation 5. GPro 6. ISTAR 7. ESRI - ArcInfo 8. ERDAS Imagine 9. PROCESS STEP

WHEN THE PROCESS OCCURRED 2006-03-30

DESCRIPTION Two separate work flows were used to complete the surface model on the project. ISTAR was used in the True Ortho area (Detroit City) and Leica GPro was used for the Ground Ortho areas (the remainder of the project). This process describes the ISTAR surface modeling for the True Ortho area. ISTAR digital surface modeling is based on an auto correlated pixel-matching system within the ISTAR software. The auto correlated digital surface model (DSM) surface represents the initial surface model. The post spacing was generated at 2 meters. The following is a step-by-step breakdown of the process. 1. Using the DSM ISTAR data set created, the technician performed a visual inspection of the data to verify that the flight lines met correctly. The technician also verified that there were no voids, and that the data covered the project limits. The technician then selected a series of areas from the dataset and inspected them where adjacent flight lines met. 2. This DSM surface is used in the rectification of True Ortho imagery. This process describes the surface modeling for the Ground Ortho areas. Socet Set digital surface modeling is based on an auto correlated pixel-matching system. Using the ADS40 Level-1 imagery and the Socet Set Automatic Terrain Extraction (ATE) tool, a DEM surface with a 2 meter post spacing was autocorrelated. ATE and ITE (Interactive Terrain Edit) are both tools in Socet Set that were used to generate and edit the DTM data. With ATE, a terrain adaptive image correlation strategy is used to create a DTM regular grid with specified post spacing. DTM grid files are created for each flight line. In ITE, buildings, trees, and all other areas that ATE could not correctly correlate were manually removed. The edited DTM data was directly used in GPro to rectify the Level-2 ortho strips. The following is a step-by-step breakdown of the process. 1. Using the DEM data set created, the technician performed a visual inspection of the data to verify that the flight lines met correctly. The technician also verified that there were no voids, and that the data covered the project limits. The technician then selected a series of areas from the dataset and inspected them where adjacent flight lines met. A process, which utilizes ITE was run to detect the differences in elevation values and profiles. The technician reviewed the results and located the areas that contained systematic errors or distortions that were introduced by the auto correlation. 2. Systematic distortions highlighted in step 1 were removed and the data were re-inspected. Corrections and adjustments can involve the application of angular deflection or compensation for curvature of the ground surface that can be introduced by crossing from one type of land cover to another. 3. The data was checked against the control network to ensure that vertical requirements were maintained. 4. Data was merged into countywide data sets, reprojected from HARN to 86 adjustment and converted to ESRI float grid format.

PROCESS STEP

WHEN THE PROCESS OCCURRED 2006-03-15

DESCRIPTION Two separate work flows were used to complete the aerotriangulation on the project. ISTAR was used in the True Ortho area (Detroit City) and Leica GPro was used for the Ground Ortho areas (the remainder of the project). For both work flows the airborne GPS data were processed and integrated with the inertial measurement unit (IMU). For the True Ortho areas the results were imported into the ISTAR system for use in the aerotriangulation. The ADS40 imagery was downloaded onto the EarthData server and brought over to the UNIX based ISTAR system. The ground control was used in conjunction with the processed airborne global positioning system (ABGPS) results for the aerotriangulation. The ground control points were read in all available imagery and tie points between flight lines were selected. A fully analytical bundle adjustment was run. The properly formatted ISTAR results were used for subsequent processing. For the Ground Ortho area the results were imported into the GPro system for use in the aerotriangulation. Aerotriangulation of ADS40 imagery were performed using the Socet Set Automatic Point Measurement (APM) tool to select the pass point between the selected bands and ORIMA to perform the analytical aerotriangulation bundle adjustment of the measurements recorded. Aerotriangulation was performed using three bands; the backward viewing pan band, the green band at nadir view and the green forward viewing band. The ground control points were read in all available imagery and tie points between flight lines were selected. A fully analytical bundle adjustment was run. The properly formatted results were used for subsequent processing.

PROCESS STEP

► WHEN THE PROCESS OCCURRED 2006-05-16

DESCRIPTION The digital orthophotography is comprised of a natural color 6-inch pixel resolution ground orthos for the counties of Livingston, Macomb, Monroe, Oakland, St. Clair, Washtenaw and Wayne. True Ortho imagery was generated in downtown Detroit (Wayne County). Oakland County received their imagery in NAD83 (86). Livingston, Macomb, Monroe, St. Clair, Washtenaw and Wayne received their imagery in NAD83 (HARN). Two separate work flows were used to complete the orthophoto production. ISTAR was used in the True Ortho area (Detroit City) and Leica GPro was used for the Ground Ortho areas (the remainder of the project). This process describes the True Ortho production. The initial radiometric adjustments were performed on the imagery for each flight line attempting to reach the best possible histogram. The rectification process was then run using the processed DSM surface and the radiometrically balanced imagery on each flight line. The quicklook (reduced resolution rectification) of each flight line exported out of ISTAR. A second set of radiometric adjustments were made using EarthData proprietary tools. The radiometrically balanced imagery was then re-imported into the ISTAR system and the histogram from the quicklook was applied to the full resolution imagery. Mosaic lines were placed, joining the ADS40 imagery strips. In initial QA/QC was performed by the technician to ensure that the mosaic lines were appropriately placed and that there was appropriate imagery coverage. The final imagery data set is removed from the ISTAR environment in a process called "packaging" where the individual tiles are created. All data processing in the ISTAR system is performed in UTM meters; it is during packaging that final datum and projection are defined. The created tiles are reviewed again for anomalies and interactive radiometric adjustment applied where needed. QA/QC was performed looking for anomalies, smears and other indications of problems within the digital Orthophoto creation process, interactive radiometric adjustment applied where needed. Two additional radiometric adjustments are applied to the completed orthos in Adobe Photoshop. The first is a sharpening mask filter; this filter is used to help increase sharpness of a digital image. The basis for this filter is to locate pixels that differ in value from surrounding pixels by the threshold specified. It then increases the pixels' contrast by the value identified. For neighboring pixels specified by the threshold, the lighter pixels get even lighter and the darker pixels get even darker based on the specified amount. The changes made maintained the integrity of the original histogram curve. The settings used were, Filter Sharpen Unsharp Mask Amount 250% Radius 1.0 Pixels Threshold 0 Levels Image Adjustments Color Balance. -12 Green Midtones Image Adjustments Brightness/Contrast. +15 The final digital ortho product was TIFF with TFW. This process describes the Ground Ortho production. Ortho-rectification is performed in GPro for the entire image strip at once, which is more efficient than managing many frame images. GPro resamples the original Level-0 image with the refined orientation produced by aerotriangulation and the requisite DEM. After the creation of the Orthophotos using GPro, the images are run through a proprietary program that adjusts the gradient across each image to improve the tone balance of the images. This program also breaks the ADS40 orthophoto strip into more manageable overlapping tiles. These orthophotos are then imported into ORTHOVISTA where radiometric and color corrections are made on multiple flight lines at once. Upon completion the images are imported into horizons' proprietary image software. Images are mosaicked together using a "path of least resistance" algorithm to generate seam lines. When the initial database is generated, the technician overlays the DEM to check for correct orientations and obvious image errors. The technician then systematically goes through the database looking at every seam. If a seam is noticeable and can be lessened or be made "invisible" by moving the seam; the Technician will evaluate the overlapping image tiles to choose the "best fit" and mosaic the "new" seam line into the image database. Once all of the seam lines have been checked and corrected ortho tiles are then clipped from the image database and put through a thorough Q/C process. Any discrepancies found are marked and corrected inside of the image database. Once this process is complete the final ortho tiles are clipped from the database. Two additional radiometric adjustments are applied to the completed orthos in Adobe Photoshop. The first is a sharpening mask filter; this filter is used to help increase sharpness of a digital image. The basis for this filter is to locate pixels that differ in value from surrounding pixels by the threshold specified. It then increases the pixels' contrast by the value identified. For neighboring pixels specified by the threshold, the lighter pixels get even lighter and the darker pixels get even darker based on the specified amount. The changes made maintained the integrity of the original histogram curve. The settings used were, Filter Sharpen Unsharp Mask Amount 250% Radius 1.0 Pixels Threshold 0 Levels Image Adjustments Color Balance. -12 Green Midtones Image Adjustments Brightness/Contrast. +15 The final digital ortho product was TIFF with TFW. Additional Ortho products are identified below. 1. 6 inch natural color county, community and township MrSID mosaics. These products are created using MrSID software. Community and township MrSID files are created with a compression ratio of 20 to 1. Countywide MrSID files 1. The original individual 6 inch natural color orthos involved in the area of interest are isolated and identified as input for the MrSID software. The desired output ratio identified and the result is one mosaiced image with the desired compression ratio. 2. Natural color resampled orthos at 1 foot and 2 foot. These files are created using EarthData proprietary software. The original 6 inch natural color orthos are input into the software with the desired pixel out put specified. 3. Black and white 6 inch orthos. These files are created using EarthData proprietary software. The original 6 inch natural color orthos are input into the software with the desired outcome of black and white specified. The program translates the red, green and blue bands into gradients of black and white resulting in a black and white rendition . All data are delivered on firewire drive or DVD.

SOURCE DATA

DESCRIPTION The aerial imagery acquisition for Southeast Michigan was flown to support the creation of digital orthophotography with a 6-inch pixel. The imagery was acquired in thirty-two sorties, the sorties were varying in size. The imagery were flown at 5,300 feet AMT. Imagery was flown with a 30% overlap between flight lines except in the areas of downtown Detroit where the imagery was flown with a 60-80% overlap to support the generation of True Ortho imagery. All imagery was collected using the Leica ADS40 digital pushbroom sensor.

Summary

The Southeast Michigan Regional Orthoimagery Project was a coordinated effort to acquire digital orthoimagery in Spring 2005 for the entire seven county region. Southeast Michigan Council of Governments lead the partnership in cooperation with Livingston, Macomb, Monroe, Oakland, St. Clair, Washtenaw, and Wayne Counties, the State of Michigan, United States Geological Survey and the Detroit Water and Sewerage Department. The local cities, villages, and townships will benefit through their partnership with the counties. - Cost savings to partners through cost sharing and coordinated project management. -Cost savings through economies of scale by contracting with a single vendor. -Sharing the combined experiences of all partners, resulting in high-quality regional imagery for the same year. -Drawing from each county partner's expertise, staff resources, and ownership commitment, they will be responsible for their own QA/QC process using common standards and training. -Providing a partnership framework for future updates of imagery after 2005.

Description

Oakland County participated in the Southeast Michigan Regional Orthoimagery project encompassing approximately 5000 square miles, which includes an additional 1/2 mile buffer beyond the boundary of the seven county region. This extends approximately 500 feet into Canada. The orthoimagery is true color with a base pixel resolution of 6 inches for the County-only imagery, and 2' for the region-wide imagery. Orthoimagery tiles were delivered in Tiff format with Tiff world files representing ground dimensions of 2000' x 3000'. Tile naming convention includes the county code, the third and fourth digit of the lower left X and the first three digits of the lower Y coordinate and the year flown. For example 161 2005, tile name would be 1612932405). Countywide and community mosaics are saved in the MrSID format. Community MrSID files are compressed at 20 to 1 using the 6 inch pixel imagery and countywide MrSIDs are compressed at 50 to 1 using the 2 foot pixel imagery. All control was based on the following -Michigan State Plane (South) - Horizontal datum -North American Datum (NAD 83) international feet second-order class I. -Vertical datum - North American Vertical Datum 1988 (NAVD88) international feet, third-order class I. All imagery was taken in the spring of 2005. Acquisition was attempted when the ground was not obscured by haze, smoke, dust, clouds or cloud shadows, and snow or ice. Flights were scheduled when solar angle was at least 30 degrees or more above the horizon Orthoimagery complies with the American Society for Photogrammetry and Remote Sensing Accuracy Standards for Class 1 mapping requirements.

DATA QUALITY REPORT - CONCEPTUAL CONSISTENCY ►

MEASURE DESCRIPTION Compliance with the accuracy standard was ensured by the collection of photo identifiable GPS ground control after the acquisition of aerial imagery. The following checks were performed. 1. The ground control and airborne GPS data stream were validated through a fully analytical bundle aerotriangulation adjustment. The RMSE is less than 1, 10,000th of the flying height. 2. The DSM (for True Ortho areas) or DEM (for ground ortho areas) data was checked against the project control. The technician visited and confirmed the accuracy of the points during initial processing 3. Digital orthophotography was validated through an inspection of edge matching and visual inspection for image quality.

[Hide Data quality report - Conceptual consistency ▲](#)

DATA QUALITY REPORT - COMPLETENESS OMISSION ►

MEASURE DESCRIPTION The following methods are used to assure imagery accuracy. 1. Use of IMU (inertial measurement unit) and ground control network utilizing GPS techniques. 2. Use of airborne GPS (global positioning system) in conjunction with the acquisition of imagery. The following software is used for validation of the imagery and surface modeling 1. Aerotriangulation - GPro and ISTAR 2. DSM and DEM data - GPro and ISTAR 3. Digital Orthophotography - ISTAR 4. Bentley - MicroStation 5. GPro 6. ISTAR 7. ESRI - ArcInfo 8. ERDAS Imagine 9. Terrascan 10. EarthData proprietary software 11. Adobe - Photoshop 12. Socetset 13. Horizons proprietary software

PROCESS STEP

WHEN THE PROCESS OCCURRED 2006-03-30

DESCRIPTION Two separate work flows were used to complete the surface model on the project. ISTAR was used in the True Ortho area (Detroit City) and Leica GPro was used for the Ground Ortho areas (the remainder of the project). This process describes the ISTAR surface modeling for the True Ortho area. ISTAR digital surface modeling is based on an auto correlated pixel-matching system within the ISTAR software. The auto correlated digital surface model (DSM) surface represents the initial surface model. The post spacing was generated at 2 meters. The following is a step-by-step breakdown of the process. 1. Using the DSM ISTAR data set created, the technician performed a visual inspection of the data to verify that the flight lines met correctly. The technician also verified that there were no voids, and that the data covered the project limits. The technician then selected a series of areas from the dataset and inspected them where adjacent flight lines met. 2. This DSM surface is used in the rectification of True Ortho imagery. This process describes the surface modeling for the Ground Ortho areas. Socet Set digital surface modeling is based on an auto correlated pixel-matching system. Using the ADS40 Level-1 imagery and the Socet Set Automatic Terrain Extraction (ATE) tool, a DEM surface with a 2 meter post spacing was autocorrelated. ATE and ITE (Interactive Terrain Edit) are both tools in Socet Set that were used to generate and edit the DTM data. With ATE, a terrain adaptive image correlation strategy is used to create a DTM regular grid with specified post spacing. DTM grid files are created for each flight line. In ITE, buildings, trees, and all other areas that ATE could not correctly correlate were manually removed. The edited DTM data was directly used in GPro to rectify the Level-2 ortho strips. The following is a step-by-step breakdown of the process. 1. Using the DEM data set created, the technician performed a visual inspection of the data to verify that the flight lines met correctly. The technician also verified that there were no voids, and that the data covered the project limits. The technician then selected a series of areas from the dataset and inspected them where adjacent flight lines met. A process, which utilizes ITE was run to detect the differences in elevation values and profiles. The technician reviewed the results and located the areas that contained systematic errors or distortions that were introduced by the auto correlation. 2. Systematic distortions highlighted in step 1 were removed and the data were re-inspected. Corrections and adjustments can involve the application of angular deflection or compensation for curvature of the ground surface that can be introduced by crossing from one type of land cover to another. 3. The data was checked against the control network to ensure that vertical requirements were maintained. 4. Data was merged into countywide data sets, reprojected from HARN to 86 adjustment and converted to ESRI float grid format.

PROCESS STEP

WHEN THE PROCESS OCCURRED 2006-03-15

DESCRIPTION Two separate work flows were used to complete the aerotriangulation on the project. ISTAR was used in the True Ortho area (Detroit City) and Leica GPro was used for the Ground Ortho areas (the remainder of the project). For both work flows the airborne GPS data were processed and integrated with the inertial measurement unit (IMU). For the True Ortho areas the results were imported into the ISTAR system for use in the aerotriangulation. The ADS40 imagery was downloaded onto the EarthData server and brought over to the UNIX based ISTAR system. The ground control was used in conjunction with the processed airborne global positioning system (ABGPS) results for the aerotriangulation. The ground control points were read in all available imagery and tie points between flight lines were selected. A fully analytical bundle adjustment was run. The properly formatted ISTAR results were used for subsequent processing. For the Ground Ortho area the results were imported into the GPro system for use in the aerotriangulation. Aerotriangulation of ADS40 imagery were performed using the Socet Set Automatic Point Measurement (APM) tool to select the pass point between the selected bands and ORIMA to perform the analytical aerotriangulation bundle adjustment of the measurements recorded. Aerotriangulation was performed using three bands; the backward viewing pan band, the green band at nadir view and the green forward viewing band. The ground control points were read in all available imagery and tie points between flight lines were selected. A fully analytical bundle adjustment was run. The properly formatted results were used for subsequent processing.

PROCESS STEP

► WHEN THE PROCESS OCCURRED 2006-05-16

DESCRIPTION The digital orthophotography is comprised of a natural color 6-inch pixel resolution ground orthos for the counties of Livingston, Macomb, Monroe, Oakland, St. Clair, Washtenaw and Wayne. True Ortho imagery was generated in downtown Detroit (Wayne County). Oakland County received their imagery in NAD83 (86). Livingston, Macomb, Monroe, St. Clair, Washtenaw and Wayne received their imagery in NAD83 (HARN). Two separate work flows were used to complete the orthophoto production. ISTAR was used in the True Ortho area (Detroit City) and Leica GPro was used for the Ground Ortho areas (the remainder of the project). This process describes the True Ortho production. The initial radiometric adjustments were performed on the imagery for each flight line attempting to reach the best possible histogram. The rectification process was then run using the processed DSM surface and the radiometrically balanced imagery on each flight line. The quicklook (reduced resolution rectification) of each flight line exported out of ISTAR. A second set of radiometric adjustments were made using EarthData proprietary tools. The radiometrically balanced imagery was then re-imported into the ISTAR system and the histogram from the quicklook was applied to the full resolution imagery. Mosaic lines were placed, joining the ADS40 imagery strips. In initial QA/QC was performed by the technician to ensure that the mosaic lines were appropriately placed and that there was appropriate imagery coverage. The final imagery data set is removed from the ISTAR environment in a process called "packaging" where the individual tiles are created. All data processing in the ISTAR system is performed in UTM meters; it is during packaging that final datum and projection are defined. The created tiles are reviewed again for anomalies and interactive radiometric adjustment applied where needed. QA/QC was performed looking for anomalies, smears and other indications of problems within the digital Orthophoto creation process, interactive radiometric adjustment applied where needed. Two additional radiometric adjustments are applied to the completed orthos in Adobe Photoshop. The first is a sharpening mask filter; this filter is used to help increase sharpness of a digital image. The basis for this filter is to locate pixels that differ in value from surrounding pixels by the threshold specified. It then increases the pixels' contrast by the value identified. For neighboring pixels specified by the threshold, the lighter pixels get even lighter and the darker pixels get even darker based on the specified amount. The changes made maintained the integrity of the original histogram curve. The settings used were, Filter Sharpen Unsharp Mask Amount 250% Radius 1.0 Pixels Threshold 0 Levels Image Adjustments Color Balance. -12 Green Midtones Image Adjustments Brightness/Contrast. +15 The final digital ortho product was TIFF with TFW. This process describes the Ground Ortho production. Ortho-rectification is performed in GPro for the entire image strip at once, which is more efficient than managing many frame images. GPro resamples the original Level-0 image with the refined orientation produced by aerotriangulation and the requisite DEM. After the creation of the Orthophotos using GPro, the images are run through a proprietary program that adjusts the gradient across each image to improve the tone balance of the images. This program also breaks the ADS40 orthophoto strip into more manageable overlapping tiles. These orthophotos are then imported into ORTHOVISTA where radiometric and color corrections are made on multiple flight lines at once. Upon completion the images are imported into horizons' proprietary image software. Images are mosaicked together using a "path of least resistance" algorithm to generate seam lines. When the initial database is generated, the technician overlays the DEM to check for correct orientations and obvious image errors. The technician then systematically goes through the database looking at every seam. If a seam is noticeable and can be lessened or be made "invisible" by moving the seam; the Technician will evaluate the overlapping image tiles to choose the "best fit" and mosaic the "new" seam line into the image database. Once all of the seam lines have been checked and corrected ortho tiles are then clipped from the image database and put through a thorough Q/C process. Any discrepancies found are marked and corrected inside of the image database. Once this process is complete the final ortho tiles are clipped from the database. Two additional radiometric adjustments are applied to the completed orthos in Adobe Photoshop. The first is a sharpening mask filter; this filter is used to help increase sharpness of a digital image. The basis for this filter is to locate pixels that differ in value from surrounding pixels by the threshold specified. It then increases the pixels' contrast by the value identified. For neighboring pixels specified by the threshold, the lighter pixels get even lighter and the darker pixels get even darker based on the specified amount. The changes made maintained the integrity of the original histogram curve. The settings used were, Filter Sharpen Unsharp Mask Amount 250% Radius 1.0 Pixels Threshold 0 Levels Image Adjustments Color Balance. -12 Green Midtones Image Adjustments Brightness/Contrast. +15 The final digital ortho product was TIFF with TFW. Additional Ortho products are identified below. 1. 6 inch natural color county, community and township MrSID mosaics. These products are created using MrSID software. Community and township MrSID files are created with a compression ratio of 20 to 1. Countywide MrSID files 1. The original individual 6 inch natural color orthos involved in the area of interest are isolated and identified as input for the MrSID software. The desired output ratio identified and the result is one mosaiced image with the desired compression ratio. 2. Natural color resampled orthos at 1 foot and 2 foot. These files are created using EarthData proprietary software. The original 6 inch natural color orthos are input into the software with the desired pixel out put specified. 3. Black and white 6 inch orthos. These files are created using EarthData proprietary software. The original 6 inch natural color orthos are input into the software with the desired outcome of black and white specified. The program translates the red, green and blue bands into gradients of black and white resulting in a black and white rendition . All data are delivered on firewire drive or DVD.

SOURCE DATA

DESCRIPTION The aerial imagery acquisition for Southeast Michigan was flown to support the creation of digital orthophotography with a 6-inch pixel. The imagery was acquired in thirty-two sorties, the sorties were varying in size. The imagery were flown at 5,300 feet AMT. Imagery was flown with a 30% overlap between flight lines except in the areas of downtown Detroit where the imagery was flown with a 60-80% overlap to support the generation of True Ortho imagery. All imagery was collected using the Leica ADS40 digital pushbroom sensor.

Aerial Photography, Digital Orthos, Imagery, Orthophotography, Southeast Michigan, Tiff, imageryBaseMapsEarthCover, Air photos

Summary

To provide color digital orthorectified aerial photography (orthophotography) for USGS 133 UA Ortho program.

Description

Oakland County is included in the Southeast Michigan Regional Orthoimagery project encompassing approximately 3613 square miles of the Detroit metropolitan area and surrounding counties. Aerial imagery was collected using an Vexcel Ultracam digital sensor. The orthoimages are composed of 4-bands (RGB and near-infrared) and are tiled to a 1500 meter x 1500 meter grid. The orthoimagery is true color with a resolution of 0.3-meter per pixel. Orthoimagery tiles were delivered in Tiff format. A total of 1170 tiles that overlap Oakland County were adjusted by USGS to mimic State Plane (2113) International Feet using a custom Python Script. The adjustment was done tile-by-tile, so some 'no data' areas exist at the edges of the tiles. All imagery was taken in the spring of 2008.

SUPPLEMENTAL INFORMATION

The datum was mis-specified in the metadata and in the GeoTIF tags. The vendor has confirmed that the imagery was collected, processed, and delivered in UTM, NAD83-HARN, but the metadata and GeoTIF headers show it as NAD83(86). The effects of this problem vary depending on both your location (the shifts are not consistent across the region) and the software used. Through most of the region, the shift is between 1 and 3 feet East-West, and less than a foot North-South. Depending on the shift, the software used, and the data available for comparison this offset may or may not be discernible. The USGS developed a set of shifted tiles that position the actual data back in NAD83(86).

PROCESS STEP

WHEN THE PROCESS OCCURRED 2008-01-01

DESCRIPTION Orthoimages were created by Sanborn Map Company, Inc. using the proprietary Metro processes. Images were rectified using the DEM and or LIDAR data along with the aerial triangulation solution. Images are mosaicked and colorbalanced using image processing tools developed by Sanborn. The images are then checked for compliance against the contract accuracy standards and corrected where non-compliant. The orthoimagery is cut to their final image file format and naming scheme provided by the USGS. For the county-wide orthoimagery, DEM supplied by USGS was used as the DEM source.

Orthophoto

Summary

The project consisted of color digital aerial imagery acquisition and color digital orthophoto production at 0.5-foot ground sample distance (GSD) for Oakland County (approximately 907 square miles). The aerial photography plan and the 2, 500 foot x 2, 500 foot digital orthophoto tiles were based on the SEMCOG approved Tile system, based upon the State Plane Grid.

Description

In the Spring of 2010, Southeast Michigan Council of Government (SEMCOG) obtained new orthoimagery for all seven of the membership counties - Livingston, Macomb, Monroe, Oakland, Washtenaw, Wayne, and St. Clair. This metadata is for Oakland County, Michigan.

PROCESS STEP

WHEN THE PROCESS OCCURRED

INDETERMINATE DATE unknown

DESCRIPTION The Leica ADS80-SH81/82 Airborne Digital Sensor acquires all digital, 12-bit data with the swath width and coverage area of a traditional film camera with up to a 5-centimeter spatial resolution. The sensor is capable of simultaneous acquisition of seven bands of imagery: three panchromatic CCD lines capture information in the forward, nadir and backward views from the aircraft, while four multispectral lines capture data in the red, green, blue, and near color infrared band. The imagery for the SEMCOG 2010 Ortho task order was acquired using the Leica ADS80-SH81/82 multispectral scanner. The fundamental resolution of the imagery was 0.5 foot. The ADS80-SH81/82 utilizes the Applanix POSAV direct positioning and orientation system that is based on airborne GPS and inertial measurement unit (IMU) technology. POSAV data were reduced using the Applanix POSPAC software package (V5.3). All of the source imagery was processed using the Leica XPRO (V4.3) software package. This package provides the capability to perform digital image processing, aerial triangulation, and image rectification. The strips of imagery were ortho rectified to existing digital elevation model (DEM) data. The individual rectified strips of ortho rectified imagery were then mosaicked together to form a seamless imagery database over the entire task order area using the OrthoVista software (V4.4) by Inpho GmbH. The final digital orthophoto imagery (DOI) 2500 x 2500 feet tiles based on the State Plane coordinates, were extracted using OrthoVista.

imageryBaseMapsEarthCover, orthoimagery, digital orthoimagery, Michigan, aerial imagery, ortho, orthophoto, Oakland

Summary

Digital orthophotos are aerial images corrected for displacement caused by relief in the Earth's surface, camera/sensor lens distortion and tilting of the sensor at the time of image acquisition. Additionally, orthophotos are assigned a uniform scale, which allows an end-user the ability to derive accurate measurements from the imagery. Orthophotos can be used as an accurate record of landscape conditions at the time of the corresponding aerial imagery. As such, the digital orthophotos are used in a variety of applications, such as environmental monitoring, facility engineering/maintenance, city/county planning, property line review, etc. The digital orthophoto can be used alone or as a raster basemap for corresponding vector line mapping.

Description

Under contract with the State of Michigan, Vexcel was contracted to produce and deliver natural Color (RGB) orthophotos for numerous areas of interest in support of Michigan's Statewide Partnership Program. Areas of interest were defined by the State. All aerial imagery was acquired using ADS direct digital sensors at an altitude sufficient for the production of digital orthophotos with a 1.0-foot or .5-foot pixel resolution as requested. Following acquisition of imagery data, survey ground control coordinates were used in-conjunction with Airborne GPS and Inertial Measurement Unit (IMU) information to establish precise spatial positioning of the image data through the process of Analytical Aero-Triangulation (AT). Upon completion of AT, the imagery was rectified to the best available digital elevation model (DEM), whether from the USGS, other high quality DEM provided by the participating government in GeoTIFF or other compatible format, or new ADS stereo imagery compiled and edited surface model using Pictovera software. The resultant rectified imagery was analyzed and radiometrically adjusted to provide the state with optimal color and tonal appearance. Manually-placed seamlines were generated to mosaic imagery from adjacent flightlines. Following mosaicking and color-balancing, multiple QA/QC processes were performed to insure optimal data quality was achieved prior to tiling the data to 5,000 by 5,000 pixel extents. All ortho tiles were clipped to an AOI shapefile (buffered to 400-meters) boundaries, as supplied by the State of Michigan. Final ortho tiles were delivered in the requested projection/units and in GeoTIFF format.

DATA QUALITY REPORT - CONCEPTUAL CONSISTENCY ►

MEASURE DESCRIPTION Compliance with the accuracy standard was ensured by the placement of GPS ground control on photo identifiable ground points during the acquisition of aerial imagery. The following checks were performed: 1. The ground control and airborne GPS/IMU data stream were validated through an aerotriangulation bundle adjustment using Pictovera software. 2. Digital orthophotography was validated through a visual inspection of control points, edge matching and general image quality. The following methods were used to ensure image quality: 1. Use of targeted ground control during image acquisition. 2. Use of GPS/IMU during image acquisition. 3. Checking of controls against ortho product. 4. Post ortho accuracy approval checks for overall image quality (tone, color balance, etc.).

[Hide Data quality report - Conceptual consistency ▲](#)

DATA QUALITY REPORT - COMPLETENESS OMISSION ►

MEASURE DESCRIPTION One foot RGB orthoimagery covers approximately 944 square miles in Oakland County, Michigan.

[Hide Data quality report - Completeness omission ▲](#)

DATA QUALITY REPORT - ABSOLUTE EXTERNAL POSITIONAL ACCURACY ►
DIMENSION horizontal

MEASURE DESCRIPTION This image complies with National Map Accuracy Standards. It has been tested at 90% confidence level to have an RMS positional displacement within 6.6 feet of well defined ground features. Does not apply to vertical surface features, such as structures, appearing in the digital orthophotography due to inherent lean, or to above ground features such as pipelines, bridge decks, and powerlines.

[Hide Data quality report - Absolute external positional accuracy ▲](#)

DATA QUALITY REPORT - ABSOLUTE EXTERNAL POSITIONAL ACCURACY ►

PROCESS STEP

WHEN THE PROCESS OCCURRED 2012-04-05

DESCRIPTION Ground survey control points were established for the dual-purpose of providing densification of the AirborneGPS/IMU information for AT purposes, as well as validation of the final orthophoto accuracy. Control points were established throughout each project area using Real-time Kinematic GPS methods, using Trimble R8 hardware. Corrections derived from the Michigan Department of Transportation CORS network (all but 4 points). Corrections derived from NGS OPUS (remaining 4 points) using minimum 20 minutes of continuous collection. All coordinate values (X,Y,Z) were transformed from NAD83-CORS96 (the datum used for correction) to WGS84-1150 using the Horizontal Time-Dependent Positioning software program (HTDP) available from the National Geodetic Survey (NGS) Geodetic Toolkit. The epoch used for the input (NAD83-CORS96) was Jan. 1, 2002. The epoch used for the output (WGS84-1150) was Jan. 1, 2001.

PROCESS STEP

► DESCRIPTION Imagery and GPS/IMU data was downloaded from mass memory unit (MMU) on the aircraft to external hard drive on the ground. GPS/IMU mission data was processed together with simultaneously collected ground-based GPS base station data in forward and reverse directions. This precisely determined the aerial camera's position and orientation in the terrain (project) coordinate system and allowed for correct orientation of the imagery.

PROCESS STEP

► DESCRIPTION The imagery was collected using Leica ADS digital sensors, which have a 62 millimeter focal length. Collection was performed using a combination of twin-engine aircraft flying at an average flying height of 9,800 feet above mean terrain with 30% sidelap, giving the collected data nominal ground sampling distance of 1foot. Based - upon the CCD Array configuration present in the ADS40 digital sensor, imagery for each flight line is 12,000 pixels in width. Red, Green, Blue, Infrared and Panchromatic image bands were collected.

PROCESS STEP

WHEN THE PROCESS OCCURRED 2012-01-01

DESCRIPTION Pixxures generated an elevation model through auto-correlation processes. Upon completion of the Aero-Triangulation (AT), PictoVera software was used to automatically correlate a dense elevation network of x, y, z (3D) points from the stereo-viewable imagery from each flight line. With a general density of approximately one point per every 1 -2 meters, the 3-D points were reviewed and manually edited for gross errors. Additional filtering was performed to remove points that were found to have been extracted from the surfaces of elevated buildings and trees, using SimActive DEM filtering software. Upon final filtering, the resulting DEM was suitable for the accurate rectification of the aerial imagery.

PROCESS STEP

▶ **WHEN THE PROCESS OCCURRED** 2012-01-01

DESCRIPTION Once rectified, the orthoimagery was mosaicked using manual seamline generation in OrthoVista Seam Editor (OVSE). The 12 bit data range was adjusted for display in standard eight bit image channels by defining a piecewise histogram stretch using OrthoVista software. A constant stretch was defined for each image collection period, and then strip by strip adjustments were made as needed to account for changes in sun angle and azimuth during the collection period. Using OrthoVista software, the imagery was mosaicked and tiled to the customer specified tile extents, 5000 pixels by 5000 pixels tiles. These went through an extensive QA/QC process to ensure customer specifications were met.

PROCESS STEP

▶ **WHEN THE PROCESS OCCURRED** 2012-01-01

DESCRIPTION Aerotriangulation blocks were defined primarily by order of acquisition and consisted of four to seventeen imagery strips. Image tie points providing the observations for the least squares bundle adjustment were selected from the images using an autocorrelation algorithm. Photogrammetric control points consisted of photo identifiable control points, collected using GPS field survey techniques. The control points were loaded into a softcopy workstation and measured in the acquired image strips. A least squares bundle adjustment of image pass points, control points and the ABGPS was performed to develop an aerotriangulation solution for each block using Pictovera software. Upon final bundle adjustment, the triangulated strips were ortho-rectified to a newly auto-correlated DEM.

.LAS, LIDAR tile index

Summary

To determine which .LAS files correlate to the area of interest, a user can locate and identify the name of the tile by referencing the LIDARTile2008 feature class. The name of the tile in the index file is the same name as the .LAS file.

Description

The LIDARTile2008 feature class is a tile index used for the 2008 .LAS files. .LAS files are stored on Oakland County's file server.

Surface Topography

gisvec1.OC.Breakline2000

Shapefiles, .tiff and MrSID

Tags

3D, elevation, elevation, digital elevation model, three dimensional, breaklines, DTM

Summary

The DTM provides the vertical component to three-dimensional modeling. Three-dimensional modeling is used to support surface hydrography and topographic mapping.

Description

The DTM was created by digitizing polygons, lines, and points and their associated ground elevations using the Black and White Digital Orthophotography of 2000 as a reference theme. Polygons and lines (breaklines) are compiled to identify abrupt changes in slope. Some examples of natural slope break features that will be represented by breaklines include the following: ditches, cliffs, fault scarps, or canyons. Unnatural examples of slope breaks include berms and grading for development.

gisvec1.OC.FiveFootContour

Shapefiles, .tiff and MrSID

Tags

topography, elevation, elevation, contour, 5 foot contour, topographic lines, five foot contour

Summary

The primary purpose of this feature class is for cartographic output. It can be used for analysis purposes, however the processing and QA procedures should be referenced beforehand.

Description

A spatial representation of five-foot topographic contour lines. This line feature class was derived from a County-wide raster that was created from the terrain dataset based on the DTM deliverables (masspoints, soft breaklines, etc.) from the 2008 LIDAR project. The key attribute is Contour.

PROCESS STEP

DESCRIPTION Sanborn provided 2008 LIDAR data to Oakland County along with corresponding DTM deliverables such as soft breaklines, masspoints, road breaklines and waterway breaklines. Oakland County GIS Data Services staff generated a terrain dataset from these DTM deliverables within ArcGIS SDE 10, and then subsequently created a raster digital elevation model (DEM) from the terrain using Spatial Analyst within ArcGIS Desktop 10. The DEM was smoothed using Neighborhood/Focal Statistics (Nearest Neighbor method) with a Mean statistic type, Rectangle neighborhood, 2-cell size height and width kernel, and 9.84 output cell size using ArcGIS 10 Desktop. The resulting County-wide contour dataset was then exported to Shapefile format to be loaded into ArcGIS 9.3 SDE, and then it was generalized within ArcGIS 9.3 Desktop using the Simplify Line tool using a Point Remove method and a 0.5-foot tolerance. The final resulting County-wide contour dataset was then loaded into ArcGIS SDE 10.

PROCESS STEP

DESCRIPTION In ArcInfo Workstation, the shapefiles were converted to double precision coverages, and edge snapped to each other using a tolerance of 10 units. The 25 individual coverages were then appended together. The resulting coverage was build on line and node.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The 3D Analyst extension was used in ArcMap to generate shapefiles for each of the 25 geographic townships. The TINs used for input were derived from 2000 orthophotography.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION The coverage was imported into a line feature class of a personal geodatabase, which was then imported into SDE. The original shapefiles and geodatabase were overlaid and visually checked to ensure any shifting only existed along the geographic township boundaries.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Using ArcEdit, dangling arcs along the geographic township boundaries were snapped (approximately 25 dangles).

Tags

topography, elevation, elevation, waterbodies, lakes, contours, inlandWaters, surface topography, inlandWaters, hydrography

Summary

The purpose of this feature class is for cartographic output. The secondary purpose is spatial analysis.

Description

A spatial representation of lake depths. This polygon feature class was derived from hard copy maps produced by the State of Michigan Conservation Department. These maps were scanned and digitized to produce this data. The hard copy maps were produced in 1947. Key attributes include the LakeName (Lake name) and Depth (below lake level).

gisvec1.OC.MassPoint2000

Shapefiles, .tiff and MrSID

Tags

3D, elevation, elevation, digital elevation model, mass points, three dimensional, DTM

Summary

The DTM provides the vertical component to three-dimensional modeling. Three-dimensional modeling is used to support surface hydrography and topographic mapping.

Description

The DTM was created by digitizing polygons, lines, and points and their associated ground elevations using the Black and White Digital Orthophotography of 2000 as a reference theme. Point features are compiled in a dense pattern of elevation points. Areas with high and low elevations are collected to identify high and low points of topology. The density of the DTM points will depend on the topology of each model. The points will be collected to maximize the efficiency for generation of the contours.

Tags

Michigan, Oakland County, DSM, Lidargrammetry, Lidar, Elevation, elevation, US, DTM, Breakline

Summary

3-dimensional masspoints are included to define the Digital Elevation Model (DEM). Together with the breaklines, the masspoints are used to define a hydrologically correct Digital Terrain Model (DTM) surface.

Description

LIDAR generated masspoints for Oakland County, MI. These point features are comprised of all bare earth-classified points from the final LiDAR LAS dataset delivered to Oakland County on 09/03/08

PROCESS STEP

WHEN THE PROCESS OCCURRED 2008-01-01

DESCRIPTION Airborne GPS Processing: Airborne GPS data was differentially processed and integrated with the post processed IMU data to derive a smoothed best estimate of trajectory (SBET). The SBET was used to reduce the LiDAR slant range measurements to a raw reflective surface for each flight line. The overlap between flight lines was removed to provide a homogeneous coverage, and the coverage was classified to extract a bare earth digital elevation model (DEM). Airborne GPS is differentially processed using the GrafNAV V7.50 software by Waypoint Consulting of Calgary, Alberta, Canada. The PDOP and distance separation is as follows: IMU data is processed using the PosPac V4.2 software by Applanix Corporation of Richmond Hill, Ontario, Canada. The reflective surface is derived using the post processing software by Optech of Toronto, ON Canada. The classification and quality control (QC) of LiDAR data is carried out using TerraScan software by Terrasolid Limited of Helsinki, Finland.

gisvec1.OC.TenFootContour

Shapefiles, .tiff and MrSID

Tags

topography, elevation, elevation, contour, ten foot contour, topographic lines, 10 foot contour

Summary

The primary purpose of this feature class is for cartographic output. It can be used for analysis purposes, however the processing and QA procedures should be referenced beforehand.

Description

A spatial representation of ten-foot topographic contour lines. This line feature class was derived from a County-wide raster that was created from the terrain dataset based on the DTM deliverables (masspoints, soft breaklines, etc.) from the 2008 LIDAR project. The key attribute is Contour.

PROCESS STEP

DESCRIPTION Sanborn provided 2008 LIDAR data to Oakland County along with corresponding DTM deliverables such as soft breaklines, masspoints, road breaklines and waterway breaklines. Oakland County GIS Data Services staff generated a terrain dataset from these DTM deliverables within ArcGIS SDE 10, and then subsequently created a raster digital elevation model (DEM) from the terrain using Spatial Analyst within ArcGIS Desktop 10. The DEM was smoothed using Neighborhood/Focal Statistics (Nearest Neighbor method) with a Mean statistic type, Rectangle neighborhood, 2-cell size height and width kernel, and 9.84 output cell size using ArcGIS 10 Desktop. The resulting County-wide contour dataset was then exported to Shapefile format to be loaded into ArcGIS 9.3 SDE, and then it was generalized within ArcGIS 9.3 Desktop using the Simplify Line tool using a Point Remove method and a 0.5-foot tolerance. The final resulting County-wide contour dataset was then loaded into ArcGIS SDE 10.

DESCRIPTION

ABSTRACT

The terrain dataset is a multiresolution, TIN-based surface that ArcSDE renders on the fly. The terrain dataset supports surface analysis and cartography. The terrain dataset resides in the SurfaceTopography dataset and is derived from the following features: masspoints, road breaklines, soft breaklines, waterway breaklines, and waterbody breaklines.

PURPOSE

The primary purpose of this feature class is spatial analysis.

SUPPLEMENTAL INFORMATION

A variety of analytic operations can be performed on terrain datasets. All the interactive tools on the 3D Analyst toolbar in ArcMap can be used with terrains. This includes profile, spot height, line of sight, steepest path, and contour tools. Geoprocessing tools provide the ability to extract any portion of a terrain surface as a raster or TIN. You then use the extracted data with any of the many tools available for rasters and TINs. [ArcGIS Desktop Help]

PROCESS STEP

PROCESS DESCRIPTION

County-wide terrain was created using ArcCatalog 9.3. Below are the load properties.

- 1.Right Click on dataset >New Terrain (surface needs to live with datasource)
- 2.The feature classes that participated in the terrain were the following: masspoints, roadbreaklines, softbreaklines, waterwaybreaklines, and waterbodybreaklines.
- 3.Point Spacing = 4.5
- 4.SFType for each feature class were as follows: masspoints (mass points), roadbreaklines (hard line), softbreaklines (soft line), waterwaybreaklines (hard line), and waterbodybreaklines (hard replace).
- 5.Window size was selected for pyramid type.
- 6.A default setting was selected for pyramid setting.
- 7.A configuration keyword was used (Terrain_Defaults).

gisvec1.OC.TwoFootContour

Shapefiles, .tiff and MrSID

Tags

topography, elevation, elevation, contour, 2 foot contour, elevation lines, two foot contour

Summary

The primary purpose of this feature class is for cartographic output. It can be used for analysis purposes, however the processing and QA procedures should be referenced beforehand.

Description

A spatial representation of two-foot topographic contour lines. This line feature class was derived from a County-wide raster that was created from the terrain dataset based on the DTM deliverables (masspoints, soft breaklines, etc.) from the 2008 LIDAR project. The key attribute is Contour.

PROCESS STEP

DESCRIPTION Sanborn provided 2008 LIDAR data to Oakland County along with corresponding DTM deliverables such as soft breaklines, masspoints, road breaklines and waterway breaklines. Oakland County GIS Data Services staff generated a terrain dataset from these DTM deliverables within ArcGIS SDE 10, and then subsequently created a raster digital elevation model (DEM) from the terrain using Spatial Analyst within ArcGIS Desktop 10. The DEM was smoothed using Neighborhood/Focal Statistics (Nearest Neighbor method) with a Mean statistic type, Rectangle neighborhood, 2-cell size height and width kernel, and 9.84 output cell size using ArcGIS 10 Desktop. The resulting County-wide contour dataset was then exported to Shapefile format to be loaded into ArcGIS 9.3 SDE, and then it was generalized within ArcGIS 9.3 Desktop using the Simplify Line tool using a Point Remove method and a 3-inch tolerance. The final resulting County-wide contour dataset was then loaded into ArcGIS SDE 10.

Summary

The Two Foot Contour feature class can be used for cartographic output as well as detailed analysis.

Description

This line feature class represents the two foot topographic contour lines. These lines were derived from TINs that were created from DTMs delivered with the 2000 orthophotography project. The key attribute is Contour.

Tags

location, location, elevation, observation, elevation, coordinate, easting, northing, coordinate value

Summary

The purpose of this information is to provide a comprehensive description of the field observations that support the Control feature class.

Description

A collection of coordinate value information that can be spatially enabled when related to the Control feature class. This information was collected from various sources included NGS datasheets and field collection methods including GPS. The key attributes include Easting, Northing, Elevation, Reference System and Horizontal Datum.

Dog License Attribute

Shapefiles, .tiff and MrSID

Tags

planningCadastre, society, planningCadastre

Summary

This table contains general information about the licensed dogs in in Oakland County. This information can be useful for planning purposes (e.g., locating new dog parks or vet clinics).

Description

This table is related to the DogLicense feature clsas, which shows the location of licensed dogs in Oakland County, MI. It contains characteristics of each licensed dog on a specific PIN.

STATUS completed

SUPPLEMENTAL INFORMATION

The source of this data is the Animal Control licensing database. The database is queried for licenses that expire last year, in the current year, and in the next 2 years. The PIN is associated with the dog license in the database using an automated process, and may not accurately represent the location of the licensed dog.

Lineage ▶

PROCESS STEP

DESCRIPTION The Animal Control database is queried for the dog licenses that expire last year, this year, and in the next 2 years. If the same parcel contains more than one license for the same dog name, only the most recent record is used. The PINs associated with the records are then selected out of the TaxParcel feature class, and the number of dogs on each parcel is summarized. A related table containing more detailed information about each dog is also created, using the same source data. The data is automatically updated on a weekly basis.

planningCadastre, planningCadastre, assessment, parcels, address, assessing

Summary

This table can be used to display or analyze address and/or assessing information.

Description

This table contains core parcel information that was queried out of the Data Warehouse Land Table after the Post March Board of Review Data Warehouse load. These are the 2004 parcel attributes as they existed for the State Equalization of the 2005 Assessment Roll.

Summary

This table can be used to display or analyze address and/or assessing information.

Description

This table contains core parcel information that is queried out of the Data Warehouse Land Table weekly. It is related to the TaxParcel feature class through the TaxParcel2ParcelAttribute relationship class. These are the 2014 parcel attributes as they existed for the State Equalization of the 2015 Assessment Roll.

Transportation

Natural Beauty Road

Shapefiles, .tiff and MrSID

Tags

road, transportation, environment, transportation, environment

Summary

This feature class is used mainly for cartographic output, but can also be used to identify areas of scenic interest to Oakland County residents and visitors.

Description

This line feature class represents Oakland County's natural beauty roads, as designated by the Road Commission for Oakland County (RCOC). The source for this data was the Act51RoadType in the RoadCenterline feature class. The roads with the County Natural Beauty type were selected and used to populate this feature class. Updates to this data are submitted annually to Oakland County Information Technology. The last time RCOC submitted data was May 2010.

Lineage ▶

PROCESS STEP

DESCRIPTION In September, 2010, the old NaturalBeautyRoad feature class was removed, and this new data model was added to ArcSDE. The new data model is a subset of the RoadCenterline data. Every week, the Act51RoadType field = 5 (County Natural Beauty) is selected from the RoadCenterline feature class on the editing ArcSDE server and written to the NaturalBeautyRoad feature class.

railroads, transportation, transportation

Summary

The primary purpose of this feature class is cartographic output and spatial analysis.

Description

A spatial representation of railroad centerlines. This linear feature class was captured through heads up digitizing at an unknown scale using Oakland County's 2000 orthoimagery for reference. Abandoned railroad features were not captured as part of this data set. Key attributes include name and revision date.

Restricted Turns

Shapefiles, .tiff and MrSID

Tags

transportation, transportation

Summary

The only purpose of this feature class is to be used as a source for the network dataset.

Description

This line feature class was created strictly to supplement routes generated by the Oakland County network dataset. It prevents routes from traversing illegal turns. Restricted turns are manually added to this feature class by tracing road centerline lines as they are needed. All of the attribution is automatically generated by ArcGIS.

Road Centerline

Shapefiles, .tiff and MrSID

Thumbnail Not Available

Tags

road, transportation, address, centerline, transportation

Summary

This primary purpose of this data set is to support computer aided dispatch (CAD) for emergency response and other geocoding projects. It is also useful for cartographic output and spatial analysis.

Description

This line feature class is a spatial representation of named road centerlines in Oakland County. This feature class was originally created through stereo compilation using Oakland County's 1997 orthophotography as reference. Key attributes include left and right address ranges and cartographic name.

SUPPLEMENTAL INFORMATION

For traveled ways that existed at the time of the orthophotography, the geometry was constructed during stereo compilation. For traveled ways that were constructed after the orthophotography, sources include more recent imagery, construction drawings, and surveys. The road names and address ranges were compiled initially from TIGER95 files. These values were then verified from independent sources and checked by city, village, and township representatives. The road segmentation was developed to optimize addressing, dispatching, and standardization of road names. The segmentation in this file will not correspond directly to TIGER segmentation. Address range values will correspond with the direction of the arc. "Low" address values will be assigned to the "From" nodes, "High" address values will be assigned to the "To" nodes. Road segments that do not have an address assigned to them may be populated with a "0" in the following fields: FromAddressLeft, ToAddressLeft, FromAddressRight, ToAddressRight. Naming and database design standards have been established for limited access thoroughfares such as interstates and state highways and their ramps. Numeric abbreviations (I75, I696, M24) will be the primary highway name identifier. Interstate and ramp identification conventions have been developed to consistently code on-ramps, off-ramps, connectors and collectors. Those ramps that connect two interstates and state highways are classified "connectors" (CONN). Service drives, which are local access roads that parallel interstates, are classified "collectors" (COLL). Those ramps that provide access to interstates from local roads, or vice versa, are classified "on-ramps or off-ramps" (ONRP, OFRP). These values are present in the StreetType field.

PROCESS STEP

DESCRIPTION In September, 2010, the new data model of the road centerline was released. There were changes to the RoadCenterline field names, along with the addition of a network dataset that can be used for routing purposes.

[Hide Process step ▲](#)

PROCESS STEP

DESCRIPTION Road centerlines are digitized using road right-of-ways that are maintained in the parcel feature dataset and/or orthoimagery as a reference theme. The additions are prompted through parcel maintenance or notification from the local jurisdiction. Address range and other attributes are verified against the site address and other external sources.

Road Intersection

Shapefiles, .tiff and MrSID

Tags

road intersections, transportation, transportation

Summary

This feature class can be used to find locations based on an intersections. It is used by various Oakland County applications.

Description

This point feature class represents all locations where 2 or more roads in the RoadCenterline file intersect. There is one point per intersection. Each point will contain at least 2, and up to 5 road names representing each unique road that participates in that intersection. This feature class is generated monthly after the updates to the RoadCenterline feature class are complete. The intersections are created using a custom built Oakland County tool. This feature class was first published in 2004.

PROCESS STEP

DESCRIPTION Every month, the road centerline editor runs the Street Sweeper's Publish>Create Intersections tool to generate the intersection points. The CartographicName field of the RoadCenterline file is used to identify locations where 2 or more unique road names intersect. The resulting personal geodatabase output is written to a network location where it is automatically picked up the road publishing tools. Before September, 2010, this file was generated via an AML that was run against a coverage.

Oakland County Trails and Pathways

Shapefiles, .tiff and MrSID

Tags

recreation, transportation, trails, paths, transportation, recreational, pathways

Summary

The primary purpose of the Oakland County Trail and Path dataset is to provide information regarding the trails and paths within Oakland County. These trails and paths are available to all residents and visitors to Oakland County and significantly add to their quality of life. This data should be used for planning and cartographic purposes.

Description

The trail/path dataset shows existing and proposed trails and paths in Oakland County and neighboring communities. The coverage was compiled from several sources including the community master plans, multi-jurisdictional trail councils/commissions, the State of Michigan, Oakland County Parks and Recreation, and the Huron-Clinton Metropolitan Authority. Hard copy sources include listings, maps and 2010 orthophotography. The scale of the data collection varies by community. The road centerline dataset was used to designate the safety path if a specific side of the road was not mentioned. The key attributes include: names of the major trails, agency that maintains the pathway, type of pathway, and various activities that are allowed on the pathway.

SUPPLEMENTAL INFORMATION

Oakland County Planning & Economic Development Services is working with local communities, agencies, interest groups, and individuals, to realize a vision of trails, paths, and greenways* throughout Oakland County. *Greenways are linear open spaces or conservation areas through which trails and paths may have a route and provide connectivity among parks and natural areas. The suggested trail/path system will evolve from actions taken by various agencies or communities to fund and implement trails/paths within the corridor options. The information shown has been supplied by various organizations including local units of government and park agencies. The information has not been field checked by Oakland County. Please consult local units of government and area park agencies for more detailed pathway information.

PROCESS STEP

DESCRIPTION The trail/path data was developed using hardcopy materials obtained from various agencies including the community master plans, multi-jurisdictional trail councils/commissions, the State of Michigan, Oakland County Parks and Recreation, and the Huron-Clinton Metropolitan Authority. The scale of the hardcopy data varies by community. Digital road centerline and orthophotography dated 1997, 2000, and 2002 was used for spatial reference during the development process. The hardcopy materials were interpreted and digitized on screen.

Summary

The only purpose of this feature class is as an automatically generated source feature class of the Transportation_ND.

Description

This point feature class is generated and used by the Transportation_ND. There is no purpose for this feature class outside of the network dataset. It is generated every time new data is loaded into the network dataset source feature classes, and the network dataset is built.
